The effect of increasingly stringent waste water requirements on solids disposal problems is discussed, with particular emphasis on the oil refining industry. The total sludge production for industry resulting from waste water treatment is expected to rise from 23.36 million tons/yr (dry) for the year 1971 to an estimated 47.27 million tons/yr by 1983. Three viable alternatives are available for the disposal of oily sludges and solids: sanitary landfill, land farming, and incineration with landfill of the resultant inert ash. Landfill is the most common and most economical technique currently used by refineries for solids disposal when transport distance is relatively short. However, increasing difficulty with securing adequate landfill sites within economic range and meeting regulatory requirements for landfills may enhance the attractiveness of land farming and incineration. Land farming requires adequate inexpensive land within reasonable transport distance to be economically feasible. Incineration has the advantages of elimination of most odors, operation independent of weather conditions, and substantial reductions in volume and weight of solids. However, its disadvantages include high initial capital investment, high operation costs for minimal volumes of solids, and supplemental fuel needs. (Kreager-FIRL)

QUEBEC ENVIRONMENTAL REGULATIONS IN THE TEXTILE INDUSTRY...AND ONE COMPANY'S SOLUTION,
C. Planzer.
Canadian Textile Journal Vol 93, No 10, p 79, 82, 84, 16, 88, October, 1976. 2 fig, 3 tab.

Descriptors: *Chemical wastes, *Textiles, *Waste water treatment, *Activated sludge, *Industrial wastes, Biological treatment, Biochemical oxygen demand, Efficiencies, Performance, sludge, Economics, Legal aspects, Pollution abatement, *Canada.
Identifiers: Latex waste, *Quebec, Textile industry.

Quebec's regulations regarding industrial water pollution and their impact on the textile industry are reviewed along with the installation of an activated sludge treatment plant at one textile manufacturing facility. As of October 8, 1975, a liquid waste management regulation which prohibits the discharge, deposit, or dumping of liquid waste into the environment has been in force. Textile plants that were disposing latex waste at a local dump are now required to dispose of these wastes in approved liquid waste management plants or to obtain a permit if they wish to dispose of it themselves. One plant's answer to the new regulation was the installation of an activated sludge treat-

ment plant. Biolcgical oxygen demand reductions in excess of 95% have been achieved thus far, although the system has been plagued by periodic upsets characterized by rising sludge in the clarifiers. Studies are underway to isolate the specific causes of this behavior. The total cost of the waste treatment facility including engineering and ultimate sludge disposal is expected to be about $4 million. (Kreager-FIRL)

NOAA'S ACTIVITIES IN ENERGY RELATED MEASUREMENT AND MONITORING,
National Oceanic and Atmospheric Administration, Rockville, Md.
A. B. Bestul, and W. L. Pugh.
In: Proceedings of National Conference on Health, Environmental Effects, and Control Technology of Energy Use, 600/7-76-002, 1976. p. 51-54.

Descriptors: *Monitoring, *Environmental effects, *Water pollution, *Energy, *Water pollution sources, Aquatic environment, *Air pollution, Oil spills, *Methodology, *Transportation, Waves(Water), Sampling, Water sampling, Data collectors, Estimating, Forecasting, On-Site data collection, Statistical methods, Weather modification.
Identifiers: *Oil spill concentration, Oil spill, *Trajectory forecast, *Shipboard environment data acquisition, *Atmospheric investigation, Velocity structure.

This paper describes the activities of the National Oceanic and Atmospheric Administration (NOAA) in energy related measurement and monitoring under the Interagency Health and Ecological Effects Program of the Presidential Five-Year Energy R and D Plan. These activities are directed at developing and applying techniques and instrumentation for impact assessment measurement and continuing monitoring of environmental pollutants arising from existing and future energy related facilities. Four projects are devoted to oceanic investigations, and three to atmospheric investigations. (See also W77-02649) (Katz)

USDA RESEARCH AND DEVELOPMENT ON EFFECTS OF ENERGY PRODUCTION AND USE OF FRESHWATER RESOURCES,
Forest Service (USDA), Washington, D.C.
H. E. Brown.
In: Proceedings of National Conference on Health, Environmental Effects, and Control Technology of Energy Use, Report 600/7-76-002, 1976. p. 126-130, 1 tab., 10 ref.

Descriptors: *Water quality, *Water resources, Water sources, Aquatic environment, *Terrestrial habitat, Fish, Wildlife, Environment, Energy, Planning, *Agriculture, *Agricultural runoff, *Forest watershed, *Forests, Water pollution, *Fuels, *Energy, Forest management, Baseline studies.
Identifiers: *Energy conservation, Fuel extraction.

Because agriculture is one of the biggest users of water in the United States, it is vitally concerned with the increasing impacts that energy-related activities are having on the Nation's water resources. U.S. Department of Agriculture agencies conducting programs directly concerned with management of agricultural and forest lands must bear responsibility for maintaining the quality and availability of water resources in the face of these impacts. Of particular concern are pollutants resulting from fuel extraction and diversion of water from agricultural to energy uses. (See also W77-02649) (Katz)
W77-02656

FRESHWATER ECOLOGICAL EFFECTS,
Tennessee Valley Authority, Chattanooga.
H. R. Hickey, and P. A. Krenkel.
In: Proceedings of National Conference on Health, Environmental Effects, and Control Technology of Energy Use, Report 600/7-76-002, 1976. p. 132-137.

Descriptors: *Water quality, *Water resources, Aquatic environment, Mining, *Strip mines, *Strip mine lakes, Ecology, Public health, *Baseline studies, Mollusca, Freshwater, Insects, *Thermal power plants, Thermal water, Methodology, *Monitoring, Zooplankton, Toxicity, *Strip mine wastes.
Identifiers: *Surface mining, *Surface mining reclamation, Freshwater insects, Aquatic insects, Aquatic thermal impacts, Zooplankton entrainment, *Ecological recovery.

TVA's research efforts in the area of freshwater ecological effects include several tasks related to impacts of energy technologies on aquatic ecosystems, effects of strip and surface mining and reclamation on water quality and ecology, and one minor project to evaluate the role of strip mine pools in the production of disease-bearing arthropods. WILDLIFE AND OIL SHALE. A PROBLEM ANALYSIS AND RESEARCH PROGRAM.
Thorne Ecological Inst., Boulder, Colo.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-250 521, Price codes: A07 in paper copy, A01 in microfiche. 1975, 112 p, 3 fig, 33 ref. Coordinated by H. D. Burke.

Descriptors: *Mining, *Mine wastes, *Colorado, *Utah, *Wyoming, *Recreation facilities, Geology, Hydrology, *Wildlife habitats, Water quality, Aquatic environment, Aquatic populations, Terrestrial habitats, Fresh water fish, Invertebrates, Social aspects, *Wildlife, Oil shale.
Identifiers: *Reptiles, *Amphibians, *Oil shale development.

This program analysis and research program considers the natural and social environment of the Oil Shale Region of northwestern Colorado, northeastern Utah, and southwestern Wyoming. The purpose was to examine and evaluate the probable consequences of a developing oil shale industry upon the environment, to devise research studies that would evaluate environmental and social changes, and to assist in avoiding or mitigating undesirable changes, particularly as they pertain to wildlife. BISCAYNE BAY AND ITS ENVIRONS. AN ANALYSIS OF ITS PRESENT AND FUTURE USES FOR METROPOLITAN DADE COUNTY,
General Oceanics, Inc., Miami, Fla.
T. W. Bilhorn.
Miami University Sea Grant Special Report No. 7, April 1976. 37 p, 4 fig, 1 tab, 15 ref. Originally issued September 1975.

Descriptors: *Florida, *Bays, *Water quality, *Coastal zone, *Pollution abatement, *Recreation demand, *Resources development, Conservation, Land use, Water utilization.
Identifiers: Environmental conditions, *Biscayne Bay(Fla), Resource management.

Biscayne Bay defines the eastern limit for the total length of Dade County. This 225 square mile water body is the single large open space immediately available to the 1 1/2 million residents of the metropolitan area. It is also the single large protected bay within the continental United States with a subtropical environment--allowing year-round usage for resident and winter tourists. Because of a mixture of natural and man-made features, the Bay divides into two units--North and South. There is a strong diversity of present use and future possibilities between these two areas. As any body of water, the Bay's internal circulation transfers the impact at one point to the remaining areas--sometimes rapidly, sometimes slowly. It is therefore a system in itself on a technical basis, and options for its use must recognize the natural factors as constraints. (NOAA)

BLOODSUCKING MOSQUITOES (DIPTERA, CULICIDAE) OF THE WHITE SEA COAST: III. BREEDING PLACES OF MOSQUITOES OF THE GENUS AEDES, (IN RUSSIAN),
Moscow State Univ. (USSR). Lab. of Zoology-Entomology.
K. V. Aleksandrova.
Biol Nauki (Mosc) 18(4), p. 18-23, 1975.

Descriptors: *Mosquitoes, *Breeding, Bogs, Coasts, Diptera, Forests, Meadows.
Identifiers: *Aedes species, Culicidae, Diptera, USSR, *White Sea(USSR), *Mosquito control.

The breeding places of 12 spp. of Aedes were found on the White Sea coast (USSR): A. communis, A. punctor, A. pullatus, A. impiger, A. hexodontus, A. pionips, A. dianteus, A. flavescens, A cinereus, A. caspius, A. intrudens and A. excrucians. These were forest, bog, meadow (littoral, floodplain), cliff and village bodies of water. They differed in temperature conditions, pH of the water, oxidizability of the water, content of dissolved O2, species composition of the mosquitoes and their abundance. Species diversity of the mosquitoes was greater in the bog, littoral and upper cliff water bodies (7 spp. in each) than in the forest and lower cliff water bodies (3 and 2 spp., respectively).--Copyright 1976, Biological Abstracts, Inc.

TWO DEVICES FOR REMOVING SUPERSATURATING GASES IN AQUARIUM SYSTEMS,
Fisheries and Marine Service, St. John's (Newfoundland). Biological Station
W. R Penrose, and W. R Squires
Transactions of American Fisheries Society, Vol. 105, No. 1, p. 116-118, 1976. 1 fig., 1 tab., 7 ref.

Descriptors: *Supersaturation, *Gases, Equipment, *Laboratory equipment, *Aquaria, *Fish diseases, Technology, Fish hatcheries, Laboratory tests, Design, Air-water interfaces.
Identifiers: *Dissolved gases.

Gas supersaturation in aquaria can be relieved by treatment of inflowing water with suitable apparatus. Two devices have been developed for this purpose. The first uses controlled agitation of falling water to bring about equilibrium and operates at flow rates near 40 liters/min; the second agitates the seawater with compressed air and is useful in the flow rate range 0 to 3 liters/min. These designs are modifiable to other flow rates (Katz)

SPILL IN PORTUGAL, A REPORT OF THE JAKOB MAERSK INCIDENT,
Environmental Protection Service, Halifax (Nova Scotia). Atlantic Region.
F. C. Duerden.
Environmental Impact and Assessment Report EPS-8-EC-76-1, Ottawa, Canada, January 1976. 32 p, 12 fig, append.

Descriptors: *Oil spills, *Coasts, *Oil pollution, Sand bars, Burning, Explosions, Beaches, Disasters, Tourism, Booms, Oil-water interfaces, Mechanical equipment, Skimming.
Identifiers: *Grounding, *Jacob Maersk oil tanker, Oil tankers, *Portugal(Leixoes), Oil slicks, Containment, Cleanup, Skimmers, Dispersants, Mechanical removal, Chemical removal.

In late January 1975, the 88,000 dwt tanker JAKOB MAERSK grounded while entering the port of Leixoes in northern Portugal. Part of the cargo burned, part escaped to sea, and the remainder polluted the shoreline. The cleanup of the oil involved units of the Portuguese Army and Navy, as well members of other agencies and the general population. In spite of the massive amount of oil spilled in the accident, the effects of the spill were relatively slight, due to a well coordinated cleanup effort and a combination of fortunate circumstances. PRACTICES, POLICIES AND TECHNOLOGY OF STORM AND COMBINED SEWERS IN FOREIGN COUNTRIES.
Albery, Pullerits, Dickenson and Associates Ltd., Don Mills (Ontario).
Canada-Ontario Agreement on the Great Lakes Water Quality, Research Report No. 45, Environmental Protection Service, Environment Canada, Ottawa, Canada, 169 p., 12 tab., 72 ref., 3 append. 74-8-17.

Descriptors: *Storm water, *Sewers, *Sewage, Governments, Costs, United States, Runoff, Research and Development, Water quality standards, *Combined sewers, Eurpe, Waste water treatment.
Identifiers: Sweden, France, Germany, United Kingdom, Switzerland, Historical backgrounds.

This study was undertaken to evaluate pollution problems associated with storm sewer discharges and combined sewer overflows in several European countries and the United States. Current methods used to abate pollution from these sources and research underway to develop new methods were also investigated. Since the magnitude of the problem and the approaches to its solution vary in each country according to the relationships between various levels of government, citizen action groups, industry and research groups, it was necessary to review the governmental structures, historical aspects, and present design criteria for all contributory features of storm and combined sewers in the countries studied. Questionnaires were distributed to local authorities, government departments, research organizations and consulting engineers in Sweden, France, the United Kingdom, Germany and Sw
zerland. In addition, research engineers visited
stallations in each country and interviewed k
personnel. This report reviews the information o
tained during the study and assesses the vario
methods of combatting pollution from storm a
combined sewers, both in the context of the cou
tries concerned, and in relation to the Canadi
situation. (Environment Canada)

Identifiers: *Effluent guidelines.

The cost of U.S. mining and milling industry co
pliance with the EPA interim water qual
guidelines for waste discharges are summari
and analyzed utilizing data obtained from Ar
Corps of Engineers applications for discharge p
mits. Cost of three basic treatment methods w
considered: (1) aeration of the waste stream,
addition of lime to raise pH, and (3) sedimentat
to remove solids. From the process design, co
capacity graphs were developed to consider m
imum flow rate, maximum lime addition,
average flow rates. Fixed capital costs, ann
operating costs, and operating cost per ton
product are reported by material being handled
is concluded that the cost of complying with

elines will prompt the mining industry to mize the production of waste water. Two case ies, the Bunker Hill electrolytic zinc plant and Bunker Hill acid mine drainage problem, are ented to illustrate possible actions to minimize e water production, and to treat combinations id mine drainage, mill wastes, and metallurgi- rocess wastes, when treatment is necessary. dtke-Wisconsin)

imposition of water quality controls has been criticized and praised for its distributional im- s in the popular literature. Few, if any, empiri- measures of the distributional impact have attempted. This research had two objectives: , to analyze methodologies of measuring in- e distribution changes, and, second, to select opriate methodology and empirically test for mpacts of water quality controls. The lognor- displaced lognormal, gamma, and beta dis- ition functions were considered as appropriate odologies. Income distribution data were col- d from all Standard Metropolitan Statistical s (SMSA) in the United States, and parame- of each of the functions were estimated. A ltaneous equation econometric model was tructed, using a factor-share approach for e and price changes. Water quality controls introduced in the model through effects on es and mean family income, and the latter vari- s were included in equations estimating the parameters of the beta distribution function. er quality data were collected for all states, ndicies of quality were estimated using analy- f variance techniques. Regressions were run a total of 172 SMSA's, adjusted so that new A's or combined SMSA's from the 1960 data e 1970 data were deleted from the study.

IRONMENTAL IMPACT OF CHEMICALS,
Chemical Co., Midland, Mich.
Moolenaar.
apers of a Seminar on Early Warning Systems Toxic Substances, held on January 30-Februa- 1974, at Battelle Research Center, Seattle, hington (EPA-560/1-75-003, July 1975), p. 167- l tab.

riptors: *Chemicals, *Chemical industry, mical analysis, *Environmental effects, ins, *Toxicity, Poisons, Industrial wastes, ic health, Industrial plants.
tifiers: Synthetic chemical compounds.

Laboratory tests ranging from simple assessments to sophisticated evaluations are used to anticipate the environmental behavior of synthetic organic chemicals in terms of lifetime, movement, bioconcentration potential and spectrum of biological activity. The development process for a new compound by the chemical industry may be divided into four distinct stages, three of which are associated with a corresponding stage in testing the likely environmental impact of a new chemical. In the first stage, the chemical formula molecular structure and some basic properties are formulated, but no impact evaluation is yet attempted. In the second stage the compound is further characterized and general use categories are defined. Environmental impact at this stage is based on the parameters of stability, movement, bioconcentration and toxicity. The third, or pilot plant stage involves manufacture of the chemical in developmental quantities, and concomitant evaluation of the stage two parametrs in greater depth. In the fourth stage, early efforts are undertaken to market the product in commercial quantities. At this stage, the production plant itself becomes a potential source of discharge into the environment and observations of the surrounding area provide a good indication if the initial test data correctly predicted environmental impact. 1974 - A YEAR OF TRANSITION,
Environmental Protection Agency, Washington, D. C. Office of Toxic Substances.
G. L. Schweitzer.
In: Papers of a Seminar on Early Warning Systems for Toxic Substances, held on January 30-February 1, 1974, at Battelle Research Center, Seattle, Washington (EPA-560/1-75-003, July 1975), p. 119-127.

Descriptors: *Chemicals, *Legal aspects, *Legislation, *Toxicity, Social aspects, Poisons, Water pollution effects, Industrial wastes, Pollution abatement, Standards, Economic impact, Social impact.

Highlights of domestic and foreign events and trends affecting environmental concerns during 1973 are reviewed, including actions by the Food and Drug Administration, Environmental Protection Agency, Department of Labor and certain state agencies impacting on regulation of toxic substances. Issues for 1974 are enumerated, including questions of : (1) the possibilities of improving toxicological testing and standard setting; (2) theretical versus pragmatic characteristics of risk/benefit aspects of toxic substances; (3) feasibility of making a generalized approach to developing control strategies for multimedia pollutants; (4) the practicality of an operational early warning system for toxic substances. Developments in the chemical industry are reviewed for their possible impacts on policy issues in toxic substance regulation and control. Generalized predictions are given for issues expected to arise in 1974, and recommendations are made for regulatory and control activities in the coming year. (See also W77-02835)

A COST-RISK-BENEFIT ANALYSIS OF TOXIC SUBSTANCES,
Environmental Protection Agency, Washington, D. C.
D. P. Tihansky, and H. Kibby.
In: Papers of a Seminar on Early Warning Systems for Toxic Substances, held on January 30-February 1, 1974, at Battelle Research Center, Seattle, Washington (EPA-560/1-75-003, July 1975), p. 93-117. 10 fig., 15 ref.

Descriptors: *Pollution abatement, *Cost-benefit analysis, *Toxins, Prices, Costs, Hazards, Decision making, Social aspects, Industrial wastes, Poisons, Evaluation, Public health, Economic impact.
Identifiers: *Cost-risk benefit analysis, Risk analysis.

An operational framework is presented which synthesizes cost-benefit analysis for product and service and risk analysis for health and ecology, to create a decision making tool through which public policy on toxic substances can be objectively derived to balance consumer demands for certain products against the environmental risks that they may engender. After risks and cost-benefit impacts are evaluated, the decision maker can compare them to set optimal control levels, setting standards so as to maximize the social welfare outcome of the decision. A number of approaches for doing this are given, with the appropriate choice dependent on the amount of risk-benefit data available to the decision maker as well as the preference for monetary versus nonmonetary values. Cost-risk benefit analysis can be simplified to some extent by minimizing costs of controlling toxic substances, subject to the avoidance of certain risks. But this objective neglects the often high value of products containing or generating toxic elements. Instead, the study assumes that the control costs are eventually paid by the consumer in the form of higher prices, and hence that product benefit changes will reflect these costs. THE WORLD HEALTH ORGANIZATION'S ENVIRONMENTAL HEALTH CRITERIA AND AIR MONITORING PROGRAMS,
National Environmental Research Center, Research Triangle Park, N.C.
F. G. Hueter, S. D. Shearer, and G. G. Akland.
In: Papers of a Seminar on Early Warning Systems for Toxic Substances, held on January 30-February 1, 1974, at Battelle Research Center, Seattle, Washington (EPA-560/1-75-003, July 1975), p 82-92.

Descriptors: *International commissions, *United Nations, *Public health, *Epidemology, *Human diseases, Toxicity, Air pollution, Water pollution effects, Diseases, Manganese, Polychlorinated biphenyls, Asbestos, Nitrogen compounds, Nitrates, Nitrites, Pollutants, Standards, Monitoring.
Identifiers: *World Health Organization.

Although the World Health Organization (WHO) as a United Nations body has no policy aimed at developing universally accepted working limits and other quality standards in their approach to environmental health measures, the organization does in fact promote agreement among international scientists on information related to the relationship between exposure to a given measure of a pollutant and accepted maximum levels of a pollutant in an organism or population group. From priority ranking of pollutants according to WHO's health criteria, agreement has been achieved on the need to examine effects of six substances: (1) oxides of nitrogen in ambient air; (2) mycotoxins, especially in largely agricultural tropical countries; (3) nitrates and nitrites in agriculture and food; (4) manganese, especially in its increasing use as a fuel additive; (5) polychlorinated biphenyls; and (6) asbestos. Procedures are described for preparing new WHO criteria documents and for preliminary reviews of pollution study procedures. Description is also given of the WHO air monitoring program, and its environmental health monitoring program. (See also W77-02835) (Harris-Wisconsin)

LEGISLATION AND LAWS CONCERNING EARLY WARNING SYSTEMS FOR TOXIC SUBSTANCES,
Committee on Commerce (U. S. Senate).
M. B. Brownlee.
In: Papers of a Seminar on Early Warning Systems for Toxic Substances, held on January 30-February 1, 1974, at Battelle Research Center, Seattle, Washigton (EPA-560/1-75-003, July 1975), p. 35-44. 2 ref.

Descriptors: *Legal aspects, *Legislation, *Toxins, *Toxicity, Social aspects, Poisons, Monitoring, Pollutants, Hazards, Environmental effects, Warning systems, Pesticides.
Identifiers: *Toxic Substances Control Act, *Consumer products, Cosmetics, Food additives, Drugs.

As of early 1974, most existing federal legislation contained no mechanisms for the premarket or premanufacture review of environmental health and safety data for chemical substances. The most important class of environmental contaminants still unregulated were phosphates in detergents, heavy metals and other constituents of consumer products such as paint and drain cleaners, PCBs, packaging and certain other potential hazards. These and other materials which either escape sewage treatment or proper solid waste disposal, or which are more efficiently controlled by regulating the product instead of its disposal, were hazards that the Toxic Substances Control Act (pending in Congress in 1974) was designed to control. Review is given of existing premarket regulatory mechanisms for other hazards and potential hazards, including pesticides, drugs, food additives, antibiotics, insulin and cosmetics. Two broad principles are given for developing public policy on toxic early warning systems: First, the rigor of premarket review should vary with the implied magnitude of the risk involved for a specific chemical or other substance; and second, the greater the latitude given to a regulatory agency for premarket review, the greater the assurance must be that discretion will be used in the application of its powers. Okeanologiya 16(1), p 91-97, 1976.

Descriptors: *Self purification, Bacteria, *Detergents, Microorganisms, *Oil pollution, *Water pollution, Seasonal, Sediments, Benthos, Oil wastes.
Identifiers: Russian-Sfsr, Shallow, *USSR, *Sea of Azov.

The spatial and seasonal changes in self-purification of the sea from oil products and detergents were studied in the Azov Sea. Farther from the coastal pollution source the self-purification is performed by different biological agents in succession. Four typical zones with specific self-purification were established. Contrary courses of pollution and self-purification processes characterize the pelagic and benthic regions of the sea. The peculiar seasonal dynamics of the self-purification processes in the shallow highly-productive area predetermine a steady accumulation of toxic matter in the benthic regions. (Bacteria and saprophytic microorganisms are mentioned.)--Copyright 1976, Biological Abstracts, Inc.

Identifiers: USSR.

For 2 yr the effect of thermal waters of large electric power plants on the physiochemical and bacteriologic properties of water was studied on individual stretches of the Tom and Kondoma rivers (USSR) to establish the long-term effect of heat-exchange waters on the rivers and conditions of water use by the population. A questionnaire inquiry of the population using the heated water for drinking (centralized water supply) showed that most of the heated water for drinking (centralized water supply) showed that most of the population considered water with a temperature > 25C unacceptably warm.--Copyright 1976, Biological Abstracts, Inc.

lentifiers: *Fluctuating shorelines, Dworshak am(Idaho), *Clearwater River(Idaho), Hydroelectric peaking, *Salmon River(Idaho).

iel changes in discharge caused by hydroelectric eaking directly affect water levels and indirectly ter benthos and fish abundance and distribution. uch effects on aquatic insect populations were easured during different peaking regimes below worshak Dam on the Clearwater River, Idaho. ere, the benthic insect community has remained latively stable, but shorelines experiencing daily uctuations are not readily colonized by some her species. Insects collectively reflected an ob-ous diel pattern, with the largest numbers drift-g at night. When converting the number of drift-g insects to a volume-flow relationship, the lar-st numbers were captured at a depth of 15 cm. A tal of 98 species, taken from 3 different depths, ere recorded. Flows in a diversion channel on the outh Fork of the Salmon River were manipulated simulate flow fluctuations below a power dam. n upstream section tested insects, a downstream ction-fish. During dewatering of the channel, alysis indicated that the insects did not seek eater interstitial depths and became displaced. epwise flow reduction caused corresponding duction in the number of chinook salmon. lthough seasonal carrying capacities of the chan-l differed, the proportion of fish remained about e same after each reduction in flow. A similar tuation was observed in an experimental labora-ry flume. The number of chinook changed rectly with the variation in the rate of flow. Ex-eme flow reductions significantly increased in-ct drift and the rate of ingestion by salmon.

Descriptors: *Cadmium, *Nickel, Metals, Water pollution, Water pollution control, *Water hyacinth, Aquatic weeds, Aquatic plants, Plant physiology, Methodology, Laboratory tests, *Louisiana.

Removal of cadmium and nickel from static water systems utilizing water hyacinths (Eichhornia crassipes) (Mart.) Solms was investigated. This aquatic plant demonstrated the ability to rapidly remove heavy metals from aqueous systems by root absorption and concentration. Water hyacinths demonstrated the ability to absorb and concentrate up to 0.67 mg of cadmium and 0.50 mg of nickel per gram of dry plant material when exposed for a 24-hour period to waters polluted with from 0.578 to 2.00 ppm of these toxic metals. One hectare of water hyacinths has the potential of removing 300 g of cadmium or nickel from 240,000 liters of water polluted with these metals during a 24-hour period. (Katz)

Descriptors: *Earthquake engineering, *Mathematical models, *Optimization, *Seismic design, Computer programs, Water resources development, *Water distribution systems, Methodology, Networks.

This 3-part interdisciplinary report develops the computational methodology for the optimal network synthesis of a water distribution system in a region of seismic activity. A mathematical programming model is developed whose optimal solution indicates which links of the network are to be constructed, the optimal flow size of each constructed link, and the seismic intensity level each constructed link should be designed to withstand. New standards and procedures of earthquake resistive design and siting of lifeline facilities are needed which reflect the acceptable risk of fatalities, disruption of human activities and property damage. The standards and procedures should be developed through joint efforts among industry associations, professional society committees and research organizations, subject to evaluation by field testing in future earthquakes. The chief ac-

complishment was providing a procedure with which to incorporate seismic risk into the optimal planning of a large scale water resource system. (Snyder-California, Davis)

PROCEEDINGS OF SEMINAR SESSIONS ON STATE WATER SUPPLY PLANNING, SEPT. - OCT. 1975, (EXECUTIVE SUMMARY).
Massachusetts Univ., Amherst. Water Resources Research Center.
Available from the National Technical Information Service, Springfield VA 22161 as PB-261 883, Price codes: A02 in paper copy, A01 in microfiche. WRRC Publication No 64, Partial Completion Report, (1976), 14 p. Editor: Barry R. Lawson. Co-Sponsored by Univ. of Mass. Water Resources Research Center and Div. of Water Resources, Mass. Dept. of Environmental Management. OWRT A-090-MASS(1).

Descriptors: *Planning, *Water supply, *Massachusetts, *Comprehensive planning, Regulation, *State governments, *Water policy, Water quality, Management.

A review of Massachusetts' experience by representatives of public agencies suggested that an outline exists of a de-facto water resources plan for the state, at least for the eastern Massachusetts component of that plan. This emerged from a review of the Corps of Engineers' Northeast Water Supply Study and the New England River Basins Commission's Southeast Water Supply Study. The need for additional diversion of water from the Connecticut River to eastern Massachusetts is one common element of the above studies as is the need for more intensive, yet flexible, planning to meet projected needs through 2020 is another. The importance of establishing strong authority for statewide planning by commitment of the Governor and Legislature was stressed as essential to an effective planning effort. Relevant issues discussed included: the need to relate water supply planning to more comprehensive water resource planning, the integration of water supply planning with area-wide waste water management planning and with formal policy of growth of the Commonwealth where this has been formally adopted. (See also W77-02619)

PROCEEDINGS OF SEMINAR SESSIONS ON STATE WATER SUPPLY PLANNING (SEPT.-OCT. 1975).
Massachusetts Univ., Amherst. Water Resources Research Center.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-261 885, Price codes: A11 in paper copy, A01 in microfiche. Water Resources Research Center Publication No 64, Completion Report FY-76-11, (1976), 234 p. OWRT A-090-MASS(2), 14-34-0001-6022.

Descriptors: *Planning, *Water supply, *Massachusetts, *Comprehensive planning, Regulation, *State governments, *Water policy, Water quality, Management.

The proceedings record the presentations and discussions of a series of seminars held in Boston in September and October 1975. The objectives of the series included a review of the Commonwealth's experience in water supply planning, specifying the goals of such planning, assessing the available knowledge including experience elsewhere, describing the steps required to establish a continuing statewide planning effort, and identifying needs for research and special studies to advance the overall program. Experience of other states (Illinois, New Jersey and Maryland) was examined. This examination stressed: (1) the essential role of the State in developing and maintaining a comprehensive plan for water supply and (2) the key interrelationship between planning and regulation. The experience of other states provided important insights on the objectives of statewide planning, on the components of a plan, and on the need for strong commitments to these efforts by the Governor, the Legislature and citizens of the State. Relevant issues discussed included: the need to relate water supply planning to more comprehensive water resource planning, the integration of water supply planning with area-wide waste water management planning and with formal policy of growth of the Commonwealth where this has been formally adopted. Attempts to forecast future water needs generally are unrealistic because they are usually based on traditional modes of water use and traditional methods of planning. A new approach toward water and planning is necessary or the situation will indeed be serious by or before the end of this century. Water is not the governing element in development because few problems are solved by water alone. Water-rich Appalachia is a depressed area. Flourishing southern California is water-deficient. One of the more significant properties of water is its mobility. Since prehistoric time this property has permitted environmental manipulations on ever-increasing scales. This has culminated in the bad environment that is characteristic of many inhabited areas of the world today. The great problems of the future will be restoration and preservation of acceptable environmental quality. Water will be prominent but not the the dominant factor. Planning choices should no longer be made solely on a traditional benefit-cost ratio. Ecological impacts must also be considered. (Woodard-USGS)

WATER RESOURCES ADMINISTRATION IN VIRGINIA: ANALYSIS AND EVALUATION,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Water Resources Research Center.
W. R. Walker, and W. E. Cox.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-262 081, Price codes: A12 in paper copy, A01 in microfiche. Bulletin 107, December 1976, 258 p. OWRT B-025-VA(2).

Descriptors: Management, *Virginia, Water resources, *Administrative agencies, Water allocation(Policy), *Institutional constraints, *Administration, *Evaluation, Legal aspects, Water quality control, State governments.
Identifiers: *Interagency cooperation.

A description and analysis of the responsibilities of virginia's administrative agencies and other governmental entities related to water resources management is presented as a basis for evaluating the adequacy of the state's institutional framework for management. Since the existing structure consists of the exercise of specific management functions by several relatively independent management entities, the study explores possible gaps in existing authority, overlapping authority, and the existence of adequate coordination mechanisms between agencies and other government bodies operating in functionally related areas of responsibility. The study focuses primarily on the state's administrative agencies. Detailed consideration is given to the operations of the State Water Control Board, State Department of Health, Virginia Soil and Water Conservation Commission, Commission of Game and Inland Fisheries, State Corporation Commission, Council on the Environment, Department of Conservation and Economic Development, Commission of Outdoor Recreation, Virginia Institute of Marine Sciences and the Virginia Port Authority. The analysis also encompasses other agencies less directly involved in water resources management as well as other governmental bodies exercising such related responsibilities as local governments, interstate commissions, special districts, and the courts of the state. Recommendations to remedy deficiencies identified in the existing structure are presented in several areas, including water policy and management philosophy, water resources development, water quality, ground water, marine resources, water-oriented recreation, and statutory updating. A primary area of concern addressed in these recommendations involves allocation of water and coordination of water resources development. It is suggested that the executive arm of state government assume a more active role in water allocation and water supply planning, and that a higher degree of coordination of water resources development with applicable policy and plans is necessary. Water quality management is another area where institutional change is needed, especially with regard to centralization of administrative responsibilities and coordination of non-point pollution control with the state's primary water quality management program.

CONOMIC MODELS OF WASTER USE, ANN UTILIZATION EXPERIENCE, CASE TUDY NUMBER 4),
ouston Univ., Tex.
G. Thompson.
vailable from the National Technical Informa-n Service, Springfield, VA 22161 as PB-247 248, ice codes: A03 in paper copy, A01 in microfiche. 75. 26 p., 19 ref.

escriptors: *Industrial water, Water pollution, lethodology, *Model studies, Estimating, conomics, *Economic justification, *Value en-neering, *Electric power, *Chemical industry, ulp and paper industry, Waste treatment, Vater utilization.
entifiers: *Iron and steel industry, *Petroleum ining, *Water use models, *Industrial water es.

conomic modeling of industrial water use and stewater treatment began as a project to in-oduce industrial cost data and economic havior into planning directed toward meeting mands for water and controlling water pollution the major water-using industries: electric wer generation, iron and steel manufacturing, troleum refining, chemicals, and pulp and paper. e models developed during this research allow entification of methods for minimizing the costs production--when given effluent charges, prices r water, and other inputs or constraints on the oduction process, such as reducing the scharge of some pollutant. As the study has ogressed, project members have shifted the cus from model development to dissemination, d then to final documentation. It seems likely at much possible utilization lies in the future. atz)

scriptors: *Institutional constraints, *Oil shale, unicipal water, Appropriations, *Water nsfer, *Water policy, *Utah, Agriculture, ater resources development, Colorado River sin, Prior appropriation, *Irrigation water, conomic impact, *Water demand.
ntifiers: Uintah Basin(Utah), White ver(Utah).

part I the institutional factors affecting water tribution in the Upper Colorado River Basin in neral and specifically the Uintah Basin are sented. The historical development of the ap-priation doctrine of water allocation is outlined l Utah water policy is examined. These institu-nal factors are analyzed in light of the prototype shale development in the Uintah Basin and ential impact on the area's agricultural sector. Oil shale water estimates are compared with Uintah Basin water availability and examined with regard to population projections and municipal water use. Utah water policy and the appropriation doctrine are viewed as restraints to efficient water transfers. In part II irrigation water is treated as a random variable. Its actual quantity is not known ahead of time. If transfers of water to oil shale production affect the variability of water used in agriculture then there will be impacts in agriculture even if the farmers receive the same average quantity of water as originally. These impacts are analyzed in the context of the expected utility maximization hypothesis, i.e., the farmers are hypothesized to maximize expected utility. The measure of an increase in variability is the 'mean preserving spread.' The analyses seek to determine the impact upon expected (average) real income (utility), expected profits (net farm income), purchased inputs, the price of water, and the price of land. The analyses are conducted for both the case where the farmers are risk neutral and where they are risk averse.

WATER QUANTITY REQUIREMENTS FOR PUBLIC SUPPLIES AND OTHER USES,
Geological Survey, Reston, Va. Water Resources Div.
J. C. Kammerer.
In: Handbook of Water Resources and Pollution Control: Published by Van Nostrand Reinhold Company, New York, N.Y., p 44-83, 1976. 9 fig, 20 tab, 45 ref.

Descriptors: *Water requirements, *Water utilization, *Water supply, *United States, Surface waters, Groundwater, Domestic water, Public utilities, Industrial water, Municipal water, Withdrawal.

Nearly two thirds of the water used (withdrawn or diverted from a source) in the United States in 1970 came from less than one third of its water-resource regions. Per capita use of water from public supplies nationwide averaged 165 gallons per day, including an estimated 75 gallons per person per day for residential uses. The largest residential water uses were for lawn watering, toilet flushing, and tub and shower bathing. Residential per capita use in 1963 (for some 100 cities, mostly large) ranged from 28 to 116 gallons per day in the 9 eastern regions and from 26 to 275 gallons per day in the 9 western regions in the conterminous United States. Maximum daily use was between 1.1 and 2.9 times the average daily use. Industries that are large water users are commonly self-supplied and not dependent on public-supply systems for most of their water. Water intake (withdrawals) by five groups of industries -- iron and steel, chemicals, pulp and paper, petroleum refining, and food -- accounts for more than 60 percent of the water used by all manufacturing industries; water for cooling is the biggest single type of water use in manufacturing. Identifiers: Storm protection, Cost effectiveness.

There are two fundamental steps in the design of any storm protection system--predicting the frequency and severity of large storms and designing and implementing an appropriate protection plan. The key to improving storm protection in Delaware is to use historical weather data to evaluate the cost effectiveness of long-run protection methods such as building revetments, maintaining sand dunes and adopting building codes and zoning laws. This study develops a method for evaluating the cost effectiveness of any type of long-run protection measure. Demonstrations of that method show that more restrictive zoning or building codes would cost more than they would save, and that there is some indication that variances in certain cases may lead to net savings. The method also was used to analyze a proposed Army Corps of Engineers project for the Delaware coast. (NOAA)

ATLANTIC OUTER CONTINENTAL SHELF ENERGY RESOURCES: ECONOMIC IMPLICATIONS FOR LONG ISLAND,
Cornell Univ. Agricultural Experiment Station, Ithaca, N. Y. Dept. of Agricultural Economics.
R. J. Kalter, and W. E. Tyner.
Report No. A.E.Res.75-1, April 1975. 85 p, 2 fig, 23 tab, 48 ref.

Descriptors: *Atlantic coastal plain, *New York, *Oil industry, *Resources development, Economics, *Coastal plains, *Oil spills, *Oil pollution, *Environmental effects, Social impact, Geology, Natural gas, Leases, Energy, Continental Shelf, Income, Employment.
Identifiers: *Outer Continental Shelf, *Energy resources, Petroleum reserves, Coastal zone, Refineries, Oil refineries, Production costs.

Three major issues are considered. First the potential impacts (both gross and net) of Atlantic Outer Continental Shelf (AOCS) activities on employment and income within the Long Island region are discussed. Second, required changes in the provision of and expenditures for public services are separately evaluated. Third, potential changes in the recreation and fishing sectors due to offshore petroleum production are analyzed. The AOCS production possibilities for the Mid-Atlantic region are reviewed. Hypothetical reserve estimates by region are provided along with projected costs of exploration and development. Alternative assumptions on timing and location of offshore leasing are analyzed to determine the sensitivity of analytical results to the leasing schedule. The economic and social impacts on Nassau and Suffolk counties are examined. Included in this analysis are potential impacts of exploration, development and productive activity. Direct and indirect income and employment impacts are focused on but fiscal implications for local governments are also reviewed. (NOAA)

Identifiers: Resource conservation, Sanctuaries, Marine sanctuaries, Coastal zone, Nation, seashore, Marine parks, Governmental policy formulation, Coastal zone management.

The resources of the Assateague Island region, particularly those in the Chincoteague Bay-Sinepuxent Bay complex would be greatly benefited by protection against development on the western shore of this bay complex. Environmental interests in the Assateague region support the designation of a marine sanctuary to serve this purpose. Local populace believe that existing controls are adequate to protect the region. Physiographically and ecologically the region is ideal for a sanctuary in that it is, plarticularly on the bay side, essentially self contained and subject to little influence from without the area. Assateague Island itself is a barrier island with sand beaches on the ocean side and marshes on the Chincoteague Bay-Sinepuxent Bay side. The Chincoteague Bay complex is a very shallow body of water. Twenty-four percent of the shoreland is presently used for agriculture, 21% is unmanaged (mostly wooded) and 10% is residential. Twenty-three percent is dedicated to recreation and approximately 19% is held as preserved area. Careful public education activities and attention to proposed sanctuary regulations will probably go a long way to mitigating general resentment of an increased federal role in the area management. ON THE HABITABILITY OF MARS, AN ... PROACH TO PLANETARY ECOSYNTHESIS.
Ames Research Center, Moffett Field, Calif.
Report No. NASA SP-414, 1976. 116 p, 18 fig, tab, 16 ref, 2 append. Edited by M. M. Aven and R. D. Mac Elroy.

Descriptors: *Environmental engineering, *Habitats, *Aerobic conditions, Adaptation, ... matology, Physical properties, Chemical properties, Energy budget, Ultraviolet radiation, *Ecology, Cyanophyta, Lichens, Photosynthesis, Computer models, Temperature control, Oxygen, *Ecosystems.
Identifiers: *Mars, Bioengineering.

The theoretical colonization of Mars by terrestrial life, including man, is examined based on the potentiality of photosynthetic oxygen generation by lichens and blue-green algae. A computer model of cyanophyta and lichen predicts that the former could generate approximately 5 mbar of oxygen in 7000 years. To produce an amount necessary for human breathing (ca. 100 mb) would take 140,000 years. The lichens would take approximately 10 times longer. The study considers modification of the Martian climate by means of advective and greenhouse heating to enhance the prospects for microbiological growth.

the possibility of adapting photosynthetic or-
isms to the present or modified Martian en-
nment by bioengineering. Such genetic modifi-
ons might dramatically increase the probability
enerating an oxygen atmosphere and greatly
ease the time needed for its generation. The
y approach is based on the Martian orbital
meters, atmospheric parameters and composi-
, surface winds, solar and ultraviolet radiation,
ace temperature in Kelvin units, polar cap
meters, and a chemical inventory. It is
rized that water ice is available in the polar
and that photosynthetic organisms can
luce an ozone shield against the intensive ul-
iolet radiation. (Auen-Wisconsin)

hodology for the utilization of LANDSAT-1
gery and aerial photography on the environ-
tal evaluation of water resources development
esented. Environmental impact statements for
r resource projects were collected and
ewed for the various regions of Texas. The en-
nmental effects of channelization and surface
undments are discussed for twelve physio-
hic regions of the state as delineated on black
white satellite (LANDSAT-1) mosaic of band
ith the aid of LANDSAT-1 imagery, represen-
e or typical transects were chosen within each
n. Profiles of each site were constructed from
graphic maps and environmental data were
mulated for each site and related to low al-
e aerial photography and enlarged LAND-
-1 false color composites. Each diagrammatic
ect, with accompanying data and photo-
hs, provides significant information for input
vironmental amenities on a local and regional
into preliminary water resources develop-
studies. The utilization of the transects pro-
a visual display of available information,
in the identification and inventory of
rces, assists in the identification of data gaps
provides a planning tool for additional data
isition. Remote sensing techniques are readily
ted to water resources planning. LANDSAT-
gery as well as conventional low altitude aeri-
otography provides the planner with a synop-
verview of the resource area. The delineation
ysiographic regions by LANDSAT-1 imagery
be helpful in defining delicate border areas
delineating broad environmental areas. Satel-
nagery is applicable for transect siting in aeri-
er basin studies or regional analysis.

A SEQUENTIAL APPROACH TO THE COUNTING OF PLANKTON ORGANISMS,
Pavia Univ. (Italy).
F. Moller, and M. Bernhard.
Journal of Experimental Marine Biology and Ecology, Vol. 15, p. 49-68, 1974. 6 fig., 7 tab., 8 ref.

Descriptors: *Methodology, *Analytical techniques, Animal populations, *Aquatic populations, *Biological communities, *Plankton, *Sampling, *Surveys, Census, Distribution, Statistical methods.

A counting strategy is described by means of which it is possible to decide, after carrying out a few counts, whether a sampled plankton population can be considered homogeneously distributed. The time saving of the proposed strategy lies in the fact that if the underlying population is homogeneously distributed only one count such as the count of the mixture of aliquots taken from all individual samples collected, would be necessary to characterize the population sufficiently. The count of this mixture may be considered as a 'mean value' equivalent to the mean obtained from the counts of all individual samples. With some experience in predicting where homogeneously and where heterogeneously distributed populations are sampled, it is possible to mix large numbers of samples and thus save a great amount of effort in the analysis of plankton populations. The samples may be collected during a survey in any way desired. (Katz)

Identifiers: Underwater surveys, *TV-camera.

Following a short review of previous underwater camera systems, a new combined underwater camera system, consisting of a remote controlled TV- and photocamera mounted on a ship-towed steel-tubing sled, is described. The method of using this apparatus for wide-range surveys of the marine littoral benthos, and the techniques used to evaluate and quantify the observations are presented. On the basis of first results obtained in the North Adriatic Sea, the efficiency of the new system is compared with various other instruments and techniques. Advantages and disadvantages, possible improvements, and future prospects are discussed. (Katz)

SURFACE WATER SUPPLY OF THE UNITED STATES, 1966-70: PART 1. NORTH ATLANTIC SLOPE BASINS--VOLUME 2. BASINS FROM NEW YORK TO DELAWARE.
Geological Survey, Reston, Va. Water Resources Div.
Available from Branch of Distribution, USGS, 1200 S. Eads St., Arlington, VA 22202, price $7.
Water-Supply Paper 2102, 1976. 985 p, 1 fig

Descriptors: *Hydrologic data, *Surface water, *Streamflow, *Lakes, *Northeast U.S., Delaware, Massachusetts, New Jersey, New York, Penn

vania, Vermont, Basic data collections, Runoff, Discharge(Water), Gaging stations, Flow measurement, Flow rates, Average flow, Reservoirs, Reservoir stages.
Identifiers: *North Atlantic slope basins, Maximum discharges, Minimum discharges, Reservoir content.

This is one of 37 reports presenting records of stage and discharge of streams, and of stage and contents of lakes and reservoirs in the United States during the 1966-70 water years; it contains the records for gaging stations and partial-record stations in the North Atlantic slope basins from New York to Delaware. The daily table for stream-gaging stations gives the mean discharge for each day and is followed by monthly and yearly summaries of total, average, maximum, and minimum discharges. Data for partial-record stations are presented in two tables. The first is a table of discharge measurements at low-flow partial-record stations, and the second is a table annual maximum stage and discharge at crest-stage stations. For most gaging stations on lakes and reservoirs the data comprise a description of the station and a monthly summary table of stage and contents. For some reservoirs a table showing daily contents or stage is given. (Woodard-USGS)

WATER-RESOURCES DATA FOR DEEP AQUIFERS ON EASTERN MONTANA,
Geological Survey, Helena, Mont. Water Resources Div.
W. B. Hopkins.
Water-Resources Investigation 76-40 (open-file report), June 1976. 37 p, 6 fig, 5 tab, 64 ref.

Descriptors: *Groundwater resources, *Groundwater availability, *Water quality, *Deep wells, *Montana, Data collections, Water yield, Chemical analysis, Water wells, Aquifer characteristics.
Identifiers: *Eastern Montana groundwater.

Water from aquifers of Mesozoic and Paleozoic age in eastern Montana is little used. This report presents maps and tables to assist in the evaluation of the water in terms of possible utility. In the southern third of eastern Montana water from the Madison Group or from the Tensleep Sandstone contains less than 2,000 milligrams per liter dissolved solids and is available in amounts of as much as 3,700 gallons per minute (230 liters per second) from individual wells. Elsewhere, dissolved-solids concentrations of water from Mesozoic and Paleozoic aquifers commonly exceed 1,000 milligrams per liter, well yields range from 5 to about 1,500 gallons per minute (0.3 to 95 liters per second), and well depths generally are greater than 1,500 feet (460 meters). INDEX TO WATER RESOURCES DATA FOR ILLINOIS,
Geological Survey, Champaign, Ill. Water Resources Div.
D. E. Winget.
Water-Resources Investigations 76-87 (open-file report), 1976. 81 p, 4 tab.

Descriptors: *Water resources, *Hydrologic data, Surface waters, *Groundwater, *Illinois, *Indexing, Sampling, Sites, Data collections, Water quality, Sediment transport, Streamflow, Low flow, Gaging stations, Drainage area, Floods.

This index to water resources data for Illinois includes 1,275 sites where surface-water and ground-water data were collected through December 31, 1975. The index is the first comprehensive tabulation of data collected in Illinois by the U.S. Geological Survey; data collection began in 1903. Information included are the county code, drainage area, datum, type of data available, period of record, where data are filed, and the name of the current cooperating agency. The surface-water index is listed sequentially by station number and also alphabetically by station name. Station numbers for the ground-water index are grouped by counties. The hydrologic unit index shows all sites and is listed by the respective hydrologic boundaries. (Woodard-USGS)

Rutgers - The State Univ., New Brunswick, N. J. Dept. of Civil and Environmental Engineering.
A. M. Oguntuase, and E. L. Bourodimos.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-261 990, Price codes: A12 in paper copy, A01 in microfiche. Rutgers University, Water Resources Research Institute, Completion Report, September 1976. 236 p, 33 fig, 22 tab, 133 ref, append. OWRT A-032-NJ(1).

Descriptors: *Storm drains, Turbulence, Equations, *Open channel flows, Sewers, Hydrodynamics, *Diffusion, *Dispersion, *Turbulent flows, *Mathematicl models, Numerical analysis, Velocity, *Computer models, *Simulation analysis, Model studies.
Identifiers: Sewer flow, *Dispersion-diffusion coefficients, Turbulent diffusion, Finite difference equations, *Mass transport equations.

The objective was to simulate through mathematical modeling and laboratory experimentation, the hydrodynamics of diffusion-dispersion processes in partially-full pipe flows descriptive of sewer flows. Equations of motion and species balance-mass transport were derived with boundary conditions applicable to free surface flows in circular pipes. Turbulent flow momentum equation was solved by a modified successive approximation (SOR) numerical technique for steady flow conditions to obtain the velocity profiles, through which turbulent diffusion coefficients were estimated. Species mass transport equations were solved numerically in the three-dimensional cases of longitudinal convection with lateral and vertical diffusion. Laboratory measurements in an experimental flume were taken to provide data for verification and comparison with the theoretical predictions. The developed computer simulation model provides adequate estimates of values of longitudinal dispersion coefficients suitable for circular open channel and sewer flow analysis, design and pollution assessment and control.

HYDRAULIC CHARACTERISTICS OF RIGOLETS PASS, LOUISIANA, HURRICANE SURGE CONTROL STRUCTURES; HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
R. C. Berger, Jr, and R. A. Boland ,Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A031

756, Price codes: A05 in paper copy, A01 in microfiche. Technical Report H-76-16, September 1976. 92 p, 10 fig, 28 tab, 12 photo, 25 plates, append.

Descriptors: *Control structures, *Hydraulic models, *Steady flow, *Currents(Water), *Louisiana, Model studies.
Identifiers: *Lake Pontchartrain(La).

The Rigolets model was a fixed-bed model constructed to undistorted linear scale ratios of 1:100 horizontally and 1:100 vertically. The region reproduced by the model is 3.2 miles of the Rigolets, starting at the Lake Pontchartrain entrance of the Rigolets. The model was equipped with the necessary appurtenances for reproduction of steady-state flow in both ebb and flood directions and accurate measurement of water-surface elevations and currents under this condition. Verification tests were conducted to make certain that the model hydraulic regimen agreed with that of the prototype. The agreement attained between water-surface elevations and current velocities from similar model and prototype conditions was considered satisfactory. The testing program consisted of water-surface elevations, current velocities, and surface current patterns for various control structure plans. Possible scouring problems near the Fort Pike State Monument were noticed during testing of plans 2, 2A, and 2B. To remedy this situation the structure was shifted 250 ft away from the Fort Pike bank of the Rigolets Pass. Additional data which were taken for each test plan in the navigation canal with the lock open are presented in Appendix A. (WES)

NUMERICAL MODELING OF RESONANT OSCILLATIONS IN DEEP DRAFT HARBORS,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
J. R. Houston.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A028 051, Price codes: A04 in paper copy, A01 in microfiche. Research Report H-76-1, July 1976. 59 p, 6 fig, 23 pl, 23 ref.

Descriptors: *Finite element analysis, *Mathematical models, *Harbors, *Waves(Water), *Numerical analysis, Model studies, *Hydraulic models.

An investigation was undertaken to evaluate numerical models that can be used to predict harbor response to long-period wave excitation for both conventional harbors with deep drafts and artificial offshore ports in deep water. Numerical models using finite difference, hybrid finite element, and Lee's method solutions are discussed and compared with analytical solutions, hydraulic model data, and prototype field data. The hybrid finite element method of solution is shown to adequately predict periods of resonant peaks and model water-surface elevation patterns in conventional and offshore harbors. Computational time requirements of this numerical model are shown to be sufficiently low to make resonant response calculations economically feasible for a wide range of incident wave periods. Use of the hybrid finite element method to evaluate deep draft harbor design or modification and to aid hydraulic model studies of harbor oscillations is discussed. (WES)

Available from the National Technical Information Service, Springfield, Va. 22161, Price codes: A08 in paper copy, A01 in microfiche. Miscellaneous Paper H-76-5, March 1976. 168 p, 4 fig, 48 tab, 94 pl.

Descriptors: *Hydraulic models, *Rivers, *Diversion, *Water quality, *Water supply, Model studies, *South Carolina, *Saline water intrusion.
Identifiers: *Charleston Harbor(SC), Cooper River(SC).

The Charleston Harbor model reproduced the Ashley, Cooper, and Wando Rivers, and a portion of the Atlantic Ocean. The model was of fixed-bed construction and was equipped with all the necessary appurtenances for accurate reproduction and measurement of tides, tidal currents, salinity intrusion, and other significant phenomena of the prototype. Hydraulic and salinity tests were made for six weekly release schedules from the Pinopolis power plant. The results of the six tests indicated that, due to redivision, tide levels in the upper Cooper River, Back River Reservoir, and the East Branch of the Cooper River were lowered by amounts between about 0.3 ft and 2.0 ft. Tides at stations in lower Cooper River, the Wando River, and the Ashley River were relatively unchanged. Surface and bottom ebb predominance was decreased drastically in the upper reaches of Cooper River, and was more nearly balanced throughout the length of Cooper River for rediversion conditions than for existing conditions. The degree of salinity stratification was significantly reduced throughout the system for rediversion conditions. (WES)

STABILITY OF RUBBLE-MOUND BREAKWATER LAHAINA HARBOR, HAWAII; HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
R. D. Carver.
Available from the National Technical Information Service, Springfield, Va. 22161 as AD/A-024 773, Price codes: A03 in paper copy, A01 in microfiche. Miscellaneous Paper H-76-8, April 1976. 31 p, 2 fig, 1 tab, 6 photo, 8 plates, 1 ref, append.

Descriptors: *Breakwaters, *Hydraulic models, *Hawaii, *Harbors, Model studies.
Identifiers: *Rubble-mound breakwaters, Lahaina Harbor(Hawaii).

A hydraulic model study was conducted to investigate the adequacy of two breakwater sections proposed for Lahaina Harbor, Hawaii. The purpose of the study was to determine (a) the stability of the structure when attacked by the largest waves which may occur in the area, (b) the amount of wave overtopping occurring for the most severe wave condition, and (c) the magnitude of transmitted wave heights associated with a selected range of incident wave conditions. All test were conducted in a 5-ft-wide, 4-ft-deep, and 119-ft-long concrete wave flume at an undistorted linear scale of 1:22 model to prototype. It was concluded that both proposed breakwater sections will (a) maintain their structural integrity, (b) meet the nonovertopping criteria, and (c) prevent excessive wave energy transmission through the breakwater. A VARIATIONAL APPROACH TO NONLINEAR WAVE THEORY,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
R. W. Whalin.
Miscellaneous Paper H-76-16, August 1976. 43 p, tab, 3 ref, append.

Descriptors: *Waves(Water), Variability, Theoretical studies, Equations, *Movement
Identifiers: *Wave reflection, Nonlinear wave theory, Equations of motion(Waves).

A variational approach to nonlinear wave theory explored by deriving the equations of motion f four sm all amplitude constant depth theories, tw finite amplitude constant depth theories, and o small amplitude variable depth theory. It is dete mined that the rotational wave theories derived more appealing than the irrotational theories. T characteristic relation is explored for the abo theories and the effect of vertical velocity on wa reflection is investigated. Further numerical a experimental efforts are warranted to investiga the validity of the equations of motion for descri ing shallow water wave phenomena. Although t methodology used requires conservation of en gy, the possibility exists that a variational a proach might be derived for a nonconservati system (thus allowing frictional energy dissipati and energy loss by breaking). DEVELOPMENT OF NAVIGATION WI LOCKS AND DAMS,
Army Engineer Waterways Experiment Statio Vicksburg, Miss.
J. J. Franco.
Available from the National Technical Inform tion Service, Springfield, Va. 22161 as AD/A-0 355, Price codes: A04 in paper copy, A01 microfiche. Miscellaneous Paper H-76-15, Ju 1976. 48 p, 9 fig, 10 ref, append.

Descriptors: *Dams, *Cofferdams, *Loc *Navigation, Rivers, Shoals, Barges.

The need for locks and dams for the developm of navigation on some streams and the proble that could be encountered are discussed in this port. Satisfactory navigation conditions depend the site selected, characteristics of the strea

ntation and arrangement of the structure and
ted facilities, and type of traffic anticipated.
vs approaching the locks could be affected by
erse currents that could be hazardous or cause
ays. The lock arrangement should consider the
rents to be caused by the completed structure
the effects of these currents on the movement
ows. Model studies can be invaluable in deter-
ing the adequacy of a proposed structure and
ifications required to eliminate any undesira-
conditions. New concepts in lock arrange-
nts should be considered to improve safety and
ciency. Shoaling in the lock approaches can
sent serious problems but can be eliminated or
imized with special structures. Cofferdam
s should consider maintenance of navigation
ng construction and the effect of scour on its
ility. Deflectors can be used to move the scour
away from the main cofferdam. (WES)

NUMERICAL ANALYSIS OF TIDAL CIRCULATION FOR LONG BEACH HARBOR; REPORT 1, EXISTING CONDITIONS AND ALTERNATE PLANS FOR PIER J COMPLETION AND TANKER TERMINAL STUDY,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
D. C. Raney.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A031 174, Price codes: A07 in paper copy, A01 in microfiche. Miscellaneous Paper H-76-4, September 1976 (Report 1 of a series). 140 p, 14 fig, 3 tab, 102 pl, 4 ref, append.

Descriptors: *Harbors, *Numerical analysis, *Piers, *Tides, *California, *Numerical analysis, Model studies.
Identifiers: *Tidal currents, *Tanker terminals, *Long Beach Harbor(Calif).

A study was conducted for Long Beach Harbor to numerically investigate tidal circulation in existing basins and to define and evaluate the impact of possible modification of Pier J on existing harbor circulation. A two-dimensional depth-averaged formulation of the hydrodynamic equations was used in the model and an implicit-explicit finite difference scheme was used to numerically solve the equations. The numerical model was verified using tide and velocity data from the prototype and from physical model tests conducted at WES. For each Pier J modification considered, overall tidal circulation patterns were obtained hourly by vector plots of the tidal velocity at each finite difference cell. The change in overall tidal circulation patterns from those presently existing were also determined. The mass flow rates through the breakwater openings and channels were calculated and compared with those flows currently existing in the harbor. Changes in flow rates as a result of the Pier J modification were identified. (WES)

LONG BEACH HARBOR NUMERICAL ANALYSIS OF HARBOR OSCILLATIONS; REPORT 1, EXISTING CONDITIONS AND PROPOSED IMPROVEMENTS,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
J. R. Houston.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A031 171, Price codes: A08 in paper copy, A01 in microfiche. Miscellaneous Paper H-76-20, September 1976 (Report 1 of a series). 194 p, 1 fig, 5 tab, 161 pl, 11 ref, append.

Descriptors: *Finite element analysis, *Harbors, *Numerical analysis, *California, *Model studies, Hydraulic models.
Identifiers: *Long Beach Harbor(Calif), Harbor oscillations.

A hybrid finite element numerical model was used to calculate harbor resonance for existing conditions and proposed improvements of Los Angeles and Long Beach Harbors. The numerical model calculates harbor oscillation for harbors of arbitrary shape and variable depth. Ten finite element numerical grids were used to calculate the response of the harbors complex for incident waves with periods from 1 to 10 min. Calculations of the model for existing conditions of the harbors were shown to be in good agreement with prototype measurements. The numerical model calculations indicate that resonant oscillations in existing harbor facilities will not be radically altered by the proposed modifications of the harbors complex. The resonant oscillations are, in general, somewhat smaller for the modified conditions of the harbors complex than for existing conditions. (WES)

DESIGN FOR WAVE PROTECTION, FLOOD CONTROL, AND PREVENTION OF SHOALING, CATTARAUGUS CREEK HARBOR, NEW YORK; HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
R. R. Bottin, Jr, and C. E. Chatham, Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A019 024, Price codes: A07 in paper copy, A01 in microfiche. Technical Report H-75-18, November 1975. 144 p, 4 fig, 23 tab, 73 photo, 30 plates, 19 ref, append.

Descriptors: *Breakwaters, *Channel improvement, *Flood control, *Harbors, *Hydraulic models, *Shoals, *Waves(Water), *New York.
Identifiers: *Cattaraugus Creek Harbor(NY).

A 1:75-scale undistorted hydraulic model of the lower 5400 ft of Cattaraugus Creek and sufficient offshore area in Lake Erie to permit generation of the required test waves was used to investigate the arrangement and design of certain proposed improvements with respect to shoaling, wave protection, and flood control. The proposed improvement plans consisted of (a) breakwaters in Lake Erie at the mouth of Cattaraugus Creek, aggregating about 2300 ft in length; (b) a berm, about 700 ft in length, extending northward from the inner end of the north breakwater to high ground; (c) a 120-ft-wide, 8-ft-deep entrance channel, about 1900 ft in length, extending from the 8-ft contour in the lake to the maneuvering area; (d) a 6-ft-deep maneuvering area 300 ft wide by 600 ft long; (e) a 120-ft-wide, 6-ft-deep channel, extending upstream approximately 1900 ft from the maneuvering area; (f) a riprapped friction section extending about 750 ft upstream from the navigation channel through the New York Central Railroad bridge; (g) two levees on the left bank aggregating about 770 ft in length; and (h) development of recreational facilities. ICE FLUSHING FROM ST. LAWRENCE SEAWAY LOCKS; HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
N. R. Oswalt.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A028 021, Price codes: A03 in paper copy, A01 in microfiche. Technical Report H-76-9, July 1976. 45 p, 4 fig, 10 photos, 9 plates.

Descriptors: *Hydraulic models, *Ice, *Ice jams, Rivers, Lakes, *Locks, *St. Lawrence Seaway, Model studies.

The St. Lawrence Seaway Development Corporation secured the service of the U.S. Army Engineer Waterways Experiment Station to determine, with the aid of physical model tests, the most effective and economical method of ridding a lock chamber of floating ice. Tests were conducted in an existing 1:25-scale lock model modified to simulate the pertinent features of the St. Lawrence Seaway Lock chambers. A manifold at the upstream end of the chamber proved best for flushing ice from the chamber. Flow through the manifold was pumped from various locations in the chamber or piped through the upstream miter gate sill; both of these methods were designed to create a sufficient slope of the water surface in the chamber to flush the ice. These model tests provided the means to determine the size and configuration of the manifold and the amount of flow required for total flushing. The concept of pumping water to an upstream manifold from the lower end of the chamber was tested with limited success. Optimum flushing of the surface ice was accomplished with four 4-ft-diam pipes spaced 16 ft apart between the lock walls with their center line level with the lower pool. A total discharge of 2000 cfs was required for optimum flushing. (WES)

LOS ANGELES AND LONG BEACH HARBORS MODEL STUDY; REPORT 3, ANALYSES OF WAVE AND SHIP MOTION DATA,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
D. L. Durham, J. K. Thompson, D. G. Outlaw, and L. G. Crosby.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A016 904, Price codes: A09 in paper copy, A01 in microfiche. Technical Report H-75-4, July 1976 (Report 3 of a series). 460 p, 4 fig, 54 tab, 37 plates, 34 ref, 9 append.

Descriptors: *Waves(Water), *Harbors, *California, *Model studies.
Identifiers: *Long Beach Harbor(Calif), *Los Angeles Harbor(Calif), *Ship motion data, *Tidal currents, Harbor oscillations.

This report describes the procedures and presents the results of analyses of prototype ship motion and wave data collected in the Los Angeles and Long Beach Harbors during a 1-yr data acquisition program. The wave data were collected by the U.S. Army Engineer Waterways Experiment Station (WES) and the ship motion data were obtained by personnel of the Ports of Los Angeles and Long Beach under the direction of the U.S. Army Engineer District, Los Angeles. All analyses of these data were performed by WES. The model study has four major objectives: (a) To determine incidence and severity of troublesome oscillations in the present harbor complex, (b) to investigate tidal circulation characteristics of the present and proposed harbors, (c) to determine the optimum plan for future expansions to provide safe and economical berthing areas, and (d) to analyze the effects of proposed expansions on the existing harbors. TIOGA OUTLET WORKS, TIOGA AND HAMMOND LAKES, SUSQUEHANNA RIVER BASIN, PENNSYLVANIA; HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
N. R. Oswalt.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A026 262, Price codes: A03 in paper copy, A01 in microfiche. Technical Report H-76-5, April 1976. 36 p, 7 fig, 8 photo, 9 plates.

Descriptors: *Hydraulic models, *Open chann
flow, *Outlet works, *Riprap, *Stilling basin
Lakes, *Pennsylvania, Model studies
Identifiers: *Tioga Lake(Penn), *Hammon
Lake(Penn), Susquehanna River Basin(Penn).

A 1:25-scale model of the Tioga outlet works w
used to determine the adequacy of the stilli
basin to perform as desired for discharges up
15,860 cfs, to study flow conditions in the e
channel, and to determine minimum ripr
requirements for the exit channel. A schematic
the intake tower, the outlet conduit, the stilli
basin, and about 600 ft of the exit channel we
reproduced in the model. The original desi
stilling basin performed satisfactorily f
discharges ranging from 2,000 to 14,000 cfs, ho
ever, flow separation and adverse vortex act
occurred with lesser flows and a pulsating jur
that overtopped the basin walls occurred w
greater flows. Performance with low release ra
was determined for both single- and double-ga
operations. Recommended changes to the origi
design stilling basin included widening the ba
from 55.5 to 72 ft, decreasing the flare of the ou
transition from 1 on 4.683 to 1 on 6, raising
basin apron 4.5 ft from el 1005.5 to 1010.0, rais
the elevation of the sidewalls from 1043.0
1048.0, and lengthening the basin approximately
ft to the 38.64-ft-long horizontal floor at the ou
portal. The minimum size riprap required for s
bility in the exit channel was determined with
design discharge of 15,860 cfs. (WES)

Carolina, Model studies.
Identifiers: *Masonboro Inlet(NC), Tidal inlets

The Masonboro Inlet fixed-bed model was c
structed of concrete to scales of 1:300 horizont
and 1:60 vertically. The model reproduced an a
extending to the -45 ft contour in the Atla
Ocean and to the extent of the influence of
inlet in the bay. The wetlands were accura
reproduced near the inlet, but those relatively
areas farther bayward were reproduced schem
cally and artificially bent into the research fl
to provide storage for the tidal prism. Model ve
cation tests assured that the model hydraulic
shoaling regimes were in satisfactory agreem
with the prototype. Preliminary testing inclu
the examination of tidal surface current patt
for various structural configurations, inclu
training structures to deflect currents away f
the north jetty, offshore breakwaters, and var
south jetty alignments. This testing indicated
construction of south jetty would aid in maint
ing a channel more centrally located between
jetties, away from the north jetty. The const
tion of a deposition basin in Banks Channel
the entrance of the inlet was also investiga

B. P. Fletcher.

ilable from the National Technical Informa- Service, Springfield, VA 22161 as ADA-030 Price codes: A04 in paper copy, A01 in rofiche. Technical Report H-76-12, August 5. 53 p, 12 fig, 2 tab, 9 photos, 10 plates.

criptors: *Dams, *Hydraulic models, illways, *Chutes, *Pennsylvania, Model stu-

tifiers: *Cowanesque River(Penn).

ts to investigate the hydraulic performance of chute spillway for Cowanesque Lake were ducted using a 1:60-scale model. Particular hasis was placed on the development of a cture that would convey flow through the e with a minimum of turbulence and waves. v approaching the structure from the left ted a severe flow contraction at the left spill- abutment which became progressively more re as the discharge increased. The flow con- tion generated a standing wave that over- ed the chute sidewall. Flow distribution at the nstream end of the chute was unsymmetrical. ral flow from the left side of the exit area ed to concentrate the jet emerging from the e along the right side of the exit channel, and cities as high as 55 fps were measured. Model indicated that a stilling basin located at the nstream end of the chute would improve the ormance of flow from the chute and in the exit nel. However, due to economic and structural iderations, a stilling basin was not considered ible, and only preliminary stilling basin tests conducted. (WES)

NECTING CHANNEL FOR TIOGA AND MOND LAKES, TIOGA RIVER AND OKED CREEK, PENNSYLVANIA; RAULIC MODEL INVESTIGATION,
Engineer Waterways Experiment Station, burg, Miss.
Oswalt, and G. A. Pickering.
able from the National Technical Informa- Service, Springfield, VA 22161 as ADA-026 Price codes: A03 in paper copy, A01 in fiche. Technical Report H-76-6, April 1976. 5 fig, 13 photo, 12 plates.

Descriptors: *Channels, *Channel improvement, *Hydraulic models, *Open channel flow, *Outlet works, Weirs, *Pennsylvania, Model studies, Lakes.
Identifiers: *Tioga Lake(Penn), *Hammond Lake(Penn).

A channel will be excavated to connect the west side of Tioga Lake with the east side of Hammond Lake to permit the two reservoirs to be operated as one flood-control project. An overflow structure will be used to keep the drainage in Tioga Lake from entering Hammond Lake until storage in Tioga Lake exceeds the weir crest el 1101 ft msl. Normal flows from Hammond Lake to Tioga Lake will be controlled by an outlet works in the structure, and flood flows in this direction will pass over the weir. The model investigation was concerned with the adequacy of the connecting channel and its associated structure. The study was conducted in a 1:80-scale model which reproduced a portion of the Tioga and Hammond reservoirs, the connecting channel including a plunge pool, weir, and outlet works, and the Tioga Lake outlet works in the structure. Concerning flow from Tioga Lake to Hammond Lake, the efficiency of the uncontrolled weir was less than originally anticipated. The plunge pool as originally designed resulted in satisfactory flow conditions for all expected discharges. The model indicated that the uncontrolled weir was more efficient than expected for flow from Hammond Lake to Tioga Lake. Flow conditions were satisfactory for both uncontrolled weir flow and for flows through the outlet works stilling basin. (WES)

GRAYS HARBOR ESTUARY, WASHINGTON, REPORT 6, 45-FT MSL (40-FT MLLW) NAVIGATION CHANNEL IMPROVEMENT STUDIES; HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
N. J. Brogdon, Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as AD A014 983, Price codes: A05 in paper copy, A01 in microfiche. Technical Report H-72-2, April 1976 (Report 6 of a series). 429 p, 39 fig, 20 tab, 12 photo, 313 plates.

Descriptors: *Channel improvement, *Hydraulic models, *Navigation, *Washington, Model studies, Estuaries, Salinity, Tidal waters.
Identifiers: *Grays Harbor Estuary(Wash), Ebb flow(Estuaries).

The existing, comprehensive fixed-bed model of the Grays Harbor estuary was used to determine the effects of enlarging (deepening and widening) the existing 35-ft-deep channel to a depth of 45 ft msl. One 45-ft improvement plan consisting of 23 groins and a relocated turning/settling basin was also investigated. Model tests were conducted on the above plans to determine effects on tidal heights, current velocities and patterns, salinity intrusion, dye dispersion, and channel shoaling. Some changes caused by the enlarged channel were: (1) Maximum current velocities were reduced by less than 0.5 fps. (2) Bottom ebb flow predominance was decreased along the navigation channel upstream from Crossover Channel. (3) Very littl change occrred in tidal heights or phase of tide. (4) Surface ebb flow predominance was increased along the entire length of the navigation channel. (5) Salinity values in the upper reaches of the estuary were increased, thus increasing upstream intrusion of the salinity wedge. (6) Dye concentrations resulting from a dye release at the bottom in the estuary entrance were increased throughout the estuary. (WES)

EFFECTS OF HURRICANE SURGE BARRIER ON HYDRAULIC ENVIRONMENT, JAMAICA BAY NEW YORK; HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
R. F. Athow, Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as ADA-030 638, Price codes: A12 in paper copy, A01 in microfiche. Technical Report H-76-14, September 1976. 264 p, 16 fig, 32 tab, 26 photo, 147 plates, 6 ref, append.

Descriptors: Hurricanes, *Barriers, Hydraulic models, *Surges, *New York, Model studies.
Identifiers: *Jamaica Bay(NY).

An existing comprehensive physical model that correctly reproduced tides, tidal currents, hurricane surges, and salinity distribution throughout the New York Harbor area and especially the Jamaica Bay complex was used to determine the effects of 13 different hurricane surge barrier plans on the hydraulic environment of Jamaica Bay. The study included tests in the model to determine: (1) The size of the ungated navigation opening that will provide the suppression required inside Jamaica Bay during periods of hurricanes and northeasterly storms; (2) the maximum current velocities in and near the navigation opening that will be experienced by navigation during normal tidal conditions; (3) the effects of the hurricane surge protection structure on tides, tidal currents, salinities, and pollution dispersion patterns within the bay for normal tide conditions; and (4) the minimum area of gated tidal passages required to maintain existing conditions in the bay with respect to salinities and pollution dispersion. PROTOTYPE TESTS, OLD RIVER LOW-SILL CONTROL STRUCTURE, APRIL 1973-JUNE 1975,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
F. M. Neilson, and A. R. Tool.
Available from the National Technical Information Service, Springfield, VA 22161 as ADA-030 971, Price codes: A06 in paper copy, A01 in microfiche. Technical Report H-76-15, September 1976. 114 p, 38 fig, 8 tab, 23 pl, 20 ref, append.

Descriptors: *Gates, *Hydraulic structures, *Prototype tests, *Vibration, *Louisiana.
Identifiers: *Old River Control Structure(La).

The following four separate series of prototype tests at Old River Low-Sill Control Structure are presented in this report. (1) High-flow vibration tests (4-5 April 1973), comprised of acceleration measurements, were made to determine the magnitude of the vibration of the structure under higher than normal flows. (2) Vibration monitor tests (16 April-1 June 1973), comprised of acceleration measurements, were made during a period in which the structure was not in a structurally sound condition. (3) Demolition tests (16-25 September 1973 and 4-15 November 1974), primarily acceleration measurements (with limited geophone and pressure cell data), were made during a period in which demolition activities (using explosive charges) were taking place near the structure. (4) Low-sill gate load tests (May-June 1975), comprised of measurements of strain, acceleration, load, and temperature, were made to determine the variations in loading that occur in the gate hoist mechanism and in the gate supports

during both typical and nontypical gate operation. Tests are briefly described and a limited sampling of the data is presented. (WES)

RESISTANCE EQUATION FOR ALLUVIAL-CHANNEL FLOW,
Geological Survey, Menlo Park, Calif. Water Resources Div.
D. E. Burkham, and D. R. Dawdy.
Proceedings of ASCE, Journal of the Hydraulics Division, Vol 102, No HY10, Paper 12462, p 1479-1489, October 1976. 3 fig, 1 tab, 19 ref. append.

Descriptors: *Alluvial channels, *Flow resistance, *Sediment transport, *Turbulent flow, *Model studies, Analytical techniques, Equations, Sediment load.

The equation developed by Keulegan for resistance to turbulent flow in uniform rigidboundary conduits can be used (with reasonably accurate results) to represent resistance to turbulent flow in alluvial channels providing that a mathematical correction is made and certain channel conditions exist. The results of this study may be useful in eliminating some of the empiricism that was introduced to reduce bias in the modified Einstein method of computing total sediment load. (Woodard-USGS)

Proceedings of ASCE, Journal of the Hydraulics Division, Vol 102, No HY7, Paper 12250, p 969-985, July 1976. 7 fig, 2 tab, 13 ref.

Descriptors: *Mixing, *Great Salt Lake, *Culverts, *Stratified flow, *Density currents, Model studies, Numerical analysis, Forecasting, Evaluation, *Utah.
Identifiers: *Great Salt Lake causeway culverts(Utah).

A causeway has effectively divided the Great Salt Lake in Utah into two lakes having different water-surface elevations and different densities. Exchange between the two lakes is by seepage through the causeway and by flow through two culverts. There are three possible flow regimes in the culverts: (1) Single layer; (2) arrested wedge; and (3) two-layer stratified flow. An analytical-numerical model is presented to predict which of the regimes will exist under given conditions to predict the discharges. Stratified flow analyses have normally assumed a horizontal water surface and small density differences. These assumptions are removed. An expanded definition of the densimetric critical conditions is given for large density differences. The model gives acceptable agreement with the 49 sets of field measurements of the culvert discharges. (Woodard-USGS)

Descriptors: *Frozen soils, *Permafrost, *Compressive strength, *Tensile strength, Laboratory tests, Silts, Soils, Freezing, Strain measurement, Strength, Mechanical properties, Strength of materials, Strain, Cold regions, Cold weather construction, Soil mechanics.

Uniaxial compression and tension tests were conducted on frozen Fairbanks silt at a temperature of -10C. A relatively stiff testing machine was operated at a constant displacement rate for each test. The tests showed that compressive strength is very sensitive to strain rate and that tensile strength is relatively insensitive to it. The compressive strength increased ten times over a strain rate range of 0.00012/s to 2.9/s. As was found in other investigations, tangent moduli increased slightly with greater strain rates. The specific energy increased at higher strain rates for compression tests and decreased slightly for tension tests. For increased strain rates, uniaxial compression strength showed no tendency to plateau; nor did the specific energy reach a minimum during uniaxial tensile testing. (Sims-ISWS)

PERFORMANCE OF LIGNITE AND SUBBIT MINOUS FLY ASH IN CONCRETE - PROGRESS REPORT,
Bureau of Reclamation, Denver, Colo. Engine ing and Research Center.
E. R. Dunstan, Jr.
Report REC-ERC-76-1, January 1976. 23 p, 6 fi tab, 14 ref. 1 append.

Descriptors: *Fly ash, *Concretes, *Lign *Pozzolans, Concrete additives, Air entrainm Concrete mixes, Concrete testing, Ceme Coals, Compressive strength, Freeze-thaw te Elasticity(Mechanical), Deterioration, Shrinka Specifications, Concrete technology, Civil gineering.
Identifiers: Subbituminous coals.

Vast reserves of subbituminous and lignite will be used in power production in the Un States in the years to come. A byproduct, fly collected from the flue gases of coal burn powerplants will be produced in large quanti Since bituminous coal fly ash has been use concrete to considerable advantage for sev years now, it is quite likely that similar use c be made of lignite and subbituminous coal ashes. If so, this material could provide a plent supply of a potentially low cost cementing med for use with portland cement in concrete. ashes were obtained from five western Un States powerplants. A complete chemical physical analysis of each lignite and subb minous ash was made, and none was found meet all requirements for a Class F pozzolan cording to Federal Specification SS-P-5 Concrete mixes were made with 15 and replacement of cement, by weight, with these ashes and compared to a mix containing no fly and to mixes containing 15 and 25% replacem of fly ash meeting the requirements for a Cla pozzolan. The resulting hardened concrete found to have adequate compressive stren reduced drying shrinkage, and satisfactory fre thaw durability, but, in some cases, drastic reduced resistance to sulfate attach. ting.
ntifiers: Tidal inlets.

laboratory investigation was performed to
fine responses of a natural quartz sand to vari-
s hydraulic conditions. The results demonstrate
performance of the material in a movable-bed
del and, when compared with the responses of
er materials, may provide a basis for the selec-
n of optimum materials for various movable-
d modeling requirements. Twenty-one tests
re performed with a 40-ft-long beach containing
inlet and with unidirectional, steady flows
ough the inlet substituting for tidal flows. The
ometric characteristics of the inlet channel,
ach profiles, inlet configurations, and material
nsport were observed for conditions with and
hout waves and for various magnitudes of flood
d ebb flows. The tests showed that the minimum
nnel area, the channel width at the location of
minimum area, and the hydraulic radius at the
ation of the minimum area were strongly re-
ed to the rate of flow through the channel. The
e of material transport was found to be weakly
ated to channel flow rate, but the sparseness of
a observations with time precluded definite
luation of this. (WES)

10. SCIENTIFIC AND TECHNICAL INFORMATION

10B. Reference and Retrieval

EXPERIENCE IN CENTRALIZED COLLECTION, PROCESSING AND ANALYSIS OF SANITARY-HYGIENIC INFORMATION, (IN RUSSIAN),
Municipal Sanitary Epidemiology Station, Novokuznetsk (USSR).
For primary bibliographic entry see Field 5A.
W77-02908

10C. Secondary Publication And Distribution

THE ENVIRONMENTAL FATE OF SELECTED POLY-NUCLEAR AROMATIC HYDROCARBONS,
Stanford Research Inst., Menlo Park, Calif.
For primary bibliographic entry see Field 5B.
W77-02625

POLLUTION ASPECTS OF CATFISH PRODUCTION - REVIEW AND PROJECTIONS,
Georgia Univ., Athens. Dept. of Agricultural Engineering.
For primary bibliographic entry see Field 5C.
W77-02626

LITERATURE STUDY OF SELECTED POTENTIAL ENVIRONMENTAL CONTAMINANTS, ANTIMONY AND ITS COMPOUNDS,
Little (Arthur D.), Inc., Cambridge, Mass.
For primary bibliographic entry see Field 05C.
W77-02629

MEDICAL AND BIOLOGIC EFFECTS OF ENVIRONMENTAL POLLUTANTS. CHROMIUM.
National Research Council, Washington, D.C. Committee on Biologic Effects of Atmospheric Pollutants.
For primary bibliographic entry see Field 05C.
W77-02635

MEDICAL AND BIOLOGIC EFFECTS OF ENVIRONMENTAL POLLUTANTS. VANADIUM.
National Research Council, Washington, D. C. Committee on Biologic Effects of Atmospheric Pollutants.
For primary bibliographic entry see Field 05C.
W77-02637

MOLYBDENUM: A TOXCOLOGICAL APPRAISAL,
Karolinska Institute, Stockholm (Sweden). Dept. of Environmental Hygiene.
For primary bibliographic entry see Field 05C.
W77-02647

THE ARCTIC COASTAL ENVIRONMENT OF ALASKA. VOL. II: A COMPILATION AND REVIEW OF SCIENTIFIC LITERATURE OF THE ARCTIC MARINE ENVIRONMENT,
Alaska Univ., College. Inst. of Marine Science.
For primary bibliographic entry see Field 05C.
W77-02665

ADVANCED WASTEWATER TECHNOLOGY, A SELECTIVE CODED BIBLIOGRAPHY,
Environmental Protection Service, Burlington (Ontario). Waste Water Technology Centre.
For primary bibliographic entry see Field 05D.
W77-02741

INDEX TO WATER RESOURCES DATA FOR ILLINOIS,
Geological Survey, Champaign, Ill. Water Resources Div.
For primary bibliographic entry see Field 07C.
W77-02990

SUBJECT INDEX

The Pathology of Pesticide Poisoning,
W77-02694 5C

Histopathological Effects of Pesticides and Related Chemicals on the Livers of Fishes,
W77-02695 5C

Chemical and Photochemical Transformation of Selected Pesticides in Aquatic Systems,
W77-02822 5C

CHLOROURACIL
Sublethal Effect of 5-Chlorouracil on Carp (Cyprinus Carpio) Larvae,
W77-03031 5C

BSORPTION
Concentrations and Concentration Factors of Heavy Metals in Brown Algae,
W77-02698 5A

Persistence of Polychlorinated Biphenyls in the Hard-Clam (Mercenaria Mercenaria) and the Effect Upon the Distribution of these Pollutants in the Estuarine Environment,
W77-02703 5C

DDE and Lindane in a Large-Scale Model Lentic Ecosystem,
W77-02713 5C

Studies on the Chemical Behavior of 106-Ru in Sea Water and its Uptake by Marine Organisms -I, Accumulation and Excretion of 106-Ru by Clam,
W77-02722 5C

Bioaccumulation of Mercury in Myoxocephalus Quadricornis (L.) (Teleostei, Cottidae) in an Unpolluted Area of the Baltic,
W77-02731 5C

The Effect of Dissolved Organic Matter in Sea Water on the Uptake of Mixed Individual Hydrocarbons and Number 2 Fuel Oil by a Marine Filter-Feeding Bivalve (Mercenaria Mercenaria),
W77-02817 5C

The Capacity of Salt Marsh Vegetation to Modify the Quality of Estuarine Waters,
W77-02830 2L

Zinc Uptake by Atlantic Salmon (Salmo Salar) Exposed to a Lethal Concentration of Zinc at 3, 11 and 19 C,
W77-03021 5C

Purging a Muddy-Earthy Flavor Taint from Rainbow Trout (Salmo Gairdneri) by Transferring to Artificial and Natural Holding Environments,
W77-03023 5G

Dieldrin in the Diet of Channel Catfish Ictalurus Punctatus): Uptake and Effect on Growth,
W77-03034 5C

SORPTION FIELD DESIGN (SEPTIC NKS)
mproving Design Criteria for Septic Tank Systems,
W77-02621 5D

STRACTS
Abstracts. Special Synposium - The Middle Atlantic Continental Shelf and New York Bight,
W77-02678 5C

ACETYLCHOLINESTERASE
Neuromuscular Function and Acetylcholin-Esterase in the Pectoral Abductor Muscle of Large-Mouth Bass (Micropterus Salmoides) as Evidenced by the Effects of Düsopropyl-fluorophosphate,
W77-03028 5C

ACID MINE WASTES
Determination of Estimated Mean Mine Water Quantity and Quality from Imperfect Data and Historical Records.
W77-03014 5B

ACID MINE WATER
Avoidance of Lime-Neutralized Iron Hydroxide Solutions by Coho Salmon in the Laboratory,
W77-02725 5C

Preliminary Results of Preimpoundment Water-Quality Studies in the Tioga River Basin, Pennsylvania and New York,
W77-02977 5B

ACID PRECIPITATION
Acid Precipitation,
W77-02800 2B

ACIDIC WATER
Avoidance of Lime-Neutralized Iron Hydroxide Solutions by Coho Salmon in the Laboratory,
W77-02725 5C

Effects of Flood Flows on Water Quality of Tioga-Hammond Lakes; Hydraulic Model Investigation,
W77-02931 5B

ACIDITY
Aqueous Ammonia Equilibrium Calculations: Effects of PH and Temperature,
W77-02720 5C

ACIDS
Supersaturation Phenomena and the Formation of Fluorapatite in Aqueous Suspensions of Phosphate Rock,
W77-03074 2G

ACTIVATED ALUMINA COLUMNS
Effluent Polishing by Filtration through Activated Alumina, Volume II, (March, 1975).
W77-02755 5D

ACTIVATED CARBON
Waste Treatment Advances: Waste Water Treatment Via Activated Carbon,
W77-02610 5D

Residual Toxicity of Ozonized Seawater to Oyster Larvae,
W77-02630 5C

Removal of Toxic Chemicals from Water with Activated Carbon,
W77-02707 5D

ACTIVATED CHARCOAL
Residual Toxicity of Ozonized Seawater to Oyster Larvae,
W77-02630 5C

ACTIVATED SLUDGE
Biological Process for Effluent and Waste Treatment as Applied in the Paper Industry,
W77-02607 5D

Advanced Treatment of Pulp Waste Water (Parapu haisui no kodo shori),
W77-02608 5D

Quebec Environmental Regulations in the Textile Industry...And One Company's Solution,
W77-02611 5G

Phosphorus Removal Demonstration Study Using Ferric Chloride and Alum at C.F.B. Uplands,
W77-02738 5D

ADAPTATION
Effects of Turbidity on Ventilation Rates and Oxygen Consumption of Green Sunfish, Lepomis Cyanellus,
W77-02697 5C

ADMINISTRATION
Water Resources Administration in Virginia: Analysis and Evaluation,
W77-02996 6B

ADMINISTRATIVE AGENCIES
Water Resources Administration in Virginia: Analysis and Evaluation,
W77-02996 6B

ADSORPTION
Advanced Treatment of Pulp Waste Water (Parapu haisui no kodo shori),
W77-02608 5D

Waste Treatment Advances: Waste Water Treatment Via Activated Carbon,
W77-02610 5D

Removal of Toxic Chemicals from Water with Activated Carbon,
W77-02707 5D

Lead Uptake in two Marine Phytoplankton Organisms,
W77-02708 5C

AEDES SPECIES
Bloodsucking Mosquitoes (Diptera, Culicidae) of the White Sea Coast: III. Breeding Places of Mosquitoes of the Genus Aedes, (In Russian),
W77-02699 5G

AERATION
The Aeration Conditions of Southern and Ciscaucasian Chernozems Under Irrigation, (In Russian),
W77-02927 2G

AERIAL PHOTOGRAPHY
Environmental Evaluation of Water Resources Development,
W77-02828 6G

Use of Automated Remote Sensing Techniques to Define the Movement of Tow-Generated Suspended Material Plumes on the Illinois and Upper Mississippi Rivers,
W77-02957 2J

AERIAL SPRAYING
Aerial Spraying of Phreatophytes with Antitranspirant,
W77-02867 3B

AEROBIC CONDITIONS
Aerobic and Anaerobic Microbial Treatment Alternatives for Shellfish Processing Wastewaters in Continuous Culture,
W77-02599 5D

On the Habitability of Mars, An Approach to Planetary Ecosynthesis.
W77-02810 6G

AEROMONADS
Computerized Scheme for the Identification of Aeromonads and Members of the Family Enterobacteriaceae,
W77-02758 5A

AEROZINE-50
Behavior of Hydrazine Compounds in Hard and Soft Water,
W77-03042 5B

AFRICA
Wave Propagation During the Ghana Upwelling,
W77-02801 2L

AGENCY DIRECTORS
Compilation of State Data for Eight Selected Toxic Substances. Volume II, Directory of State Toxic Substances Monitoring Agencies,
W77-02642 5G

AGGRESSIVE BEHAVIOR (LOBSTERS)
Effects of Water Temperature and Housing Conditions Upon the Aggressive Behavior of the Lobster Homarus Americanus,
W77-03050 5C

AGRICULTURAL RUNOFF
USDA Research and Development on Effects of Energy Production and Use of Freshwater Resources,
W77-02656 5G

Hydraulic Simulation Using Distributed Parameters,
W77-03001 2A

AGRICULTURAL WATERSHEDS
Hydraulic Simulation Using Distributed Parameters,
W77-03001 2A

AGRICULTURE
USDA Research and Development on Effects of Energy Production and Use of Freshwater Resources,
W77-02656 5G

The Effect of Agriculture on the Surroundings of Lake Balaton,
W77-02776 5B

AGRONOMIC CROPS
Crop Production in the Arid Zone with Special Reference to Western Rajasthan,
W77-02869 3F

AIR MONITORING
Monitoring Western Energy Resource Developments,
W77-02651 5G

AIR POLLUTION
Environmental Outlook: Where We Stand, What's Ahead,
W77-02580 5G

Incineration of Industrial Wastes,
W77-02596 5E

Air and Water Purification - with Acid Chlorite Solution.
W77-02613 5D

Comparative Methylation Chemistry of Platinum, Palladium, Lead, and Manganese,
W77-02623 5A

Sampling and Analysis of Selected Toxic Substances. Task II-Ethylene Dibromide,
W77-02644 5A

NOAA's Activities In Energy Related Measurement and Monitoring,
W77-02652 5G

The Location of Industrial Water Users and Air Pollution: An Overlooked Relationship,
W77-02877 5B

Environmental Measurements of Air and Water Quality,
W77-02880 5A

Experience in Centralized Collection, Processing and Analysis of Sanitary-Hygienic Information, (In Russian),
W77-02908 5A

AIRPORTS
Lake Erie International Jetport Model Feasibility Investigation; Application of Three-Dimensional Hydrodynamic Model to Study Effects of Proposed Jetport Island on Thermocline Structure in Lake Erie,
W77-02994 2H

ALASKA
Trace Hydrocarbon Analysis: The National Bureau of Standards, Prince William Sound/Northeastern Gulf of Alaska, Baseline Study,
W77-02628 5A

The Arctic Coastal Environment of Alaska. Vol. II: A Compilation and Review of Scientific Literature of the Arctic Marine Environment,
W77-02665 5C

Formulas Used to Analyze Wind-Driven Currents as First-Order Autoregressive Processes,
W77-02670 2L

Sediment Dispersal Patterns as Clues to Placer-like Platinum Accumulation in and Near Chagvan Bay, Alaska,
W77-02681 5B

ALBERTA (CANADA)
Effects of Pulpwood Harvesting on the Quality of Stream Waters of Forest Catchments Representing a Large Area in Western Alberta, Canada,
W77-02774 5B

ALEWIFE
Lethal and Preferred Temperatures of the Alewife (Alosa Pseudoharengus) in Lake Michigan,
W77-02710 5C

The Distribution and Abundance of Larval Fishes Along the Western Shore of Lake Erie at Monroe, Michigan,
W77-03011 2H

ALFALFA
Soil Water Extraction by Alfalfa,
W77-03064 3C

Minimal Leaching with Varying Root Depths of Alfalfa,
W77-03066 3C

Yield Response of Alfalfa Cultivars and Clones to Several pH Levels in Tatum Subsoil,
W77-03075 3F

ALGAE
Methods of Investigating Phytobenthos of Continental Water Bodies, (In Russian),
W77-02742 5A

Concentrations of Copper, Iron, Lead, Nickel and Zinc in Freshwater Algal Blooms,
W77-02813 5A

ALGAL TOXINS
Toxicity of the Surgeon Fishes-II Properties of the Principal Water Soluble Toxin,
W77-02700 5C

ALKALINE WATER
Effects of Flood Flows on Water Quality of Tioga-Hammond Lakes; Hydraulic Model Investigation,
W77-02931 5B

ALKYTIN COMPOUNDS
The Manufacture and Use of Selected Alkyltin Compounds, Task II,
W77-02634 5B

ALLUVIAL AQUIFERS
Waterlogging in an Alluvial Aquifer Near Lake Minnequa, Pueblo, Colorado,
W77-02983 2F

ALLUVIAL CHANNELS
Resistance Equation for Alluvial-Channel Flow,
W77-02971 8I

ALOSA SP
Lethal and Preferred Temperatures of the Alewife (Alosa Pseudoharengus) in Lake Michigan,
W77-02710 5C

ALUM
Phosphorus Removal Demonstration Study Using Ferric Chloride and Alum at C.F.B. Uplands,
W77-02738 5D

ALUMINUM
Changes in the Physical Properties of Soil Clays Due to Precipitated Aluminum and Iron Hydroxides: I. Swelling and Aggregate Stability After Drying,
W77-03073 2G

Yield Response of Alfalfa Cultivars and Clones to Several pH Levels in Tatum Subsoil,
W77-03075 3F

AMINO ACIDS
Amino Acid and Fractional Composition of Protein of the Vegetative Mass of Corn at Different Levels of Mineral Nutrition and Water Supply, (In Russian),
W77-02918 3F

AMMONIA
Lesions Associated with Chronic Exposure to Ammonia,
W77-02693 5C

Aqueous Ammonia Equilibrium Calculations Effects of PH and Temperature,
W77-02720 5C

The Biology and Chemistry of a Warm-Water Stream,
W77-03010 5C

Excretion of Ammonia and Inorganic Phosphorous by Euphausia Pacifica and Metridia Pacifica at Different Concentrations of Phytoplankton,
W77-03036 5C

AMPHIBIANS
Wildlife and Oil Shale. A Problem Analysis and Research Program.
W77-02659 5C

HIPODA
sponse of Two Arctic Amphipods, Gam-rus Zaddachi and Boeckosimus (Onisimus) inis to Variations in Temperature and Salini-
7-03019 5C

HIPODS
tribution of Amphipoda in the Dniester uary and its Possible Changes in Connection h the Regulation of the Dniester River, (In ssian),
7-02914 5C

EROBIC CONDITIONS
robic and Anaerobic Microbial Treatment ernatives for Shellfish Processing Waste-ers in Continuous Culture,
7-02599 5D

EROBIC DIGESTION
aerobic Digestion of Lime Sewage Sludge,
7-02750 5D

LYTICAL METHODS
ce Hydrocarbon Analysis: The National Bu-u of Standards, Prince William nd/Northeastern Gulf of Alaska, Baseline dy,
7-02628 5A

LYTICAL TECHNIQUES
Sequential Approach to the Counting of nkton Organisms,
7-02721 7B

plications of Direct Aqueous Injection Gas romatography and Freeze Concentration for Determination of Organic Compounds in ter and Waste Waters,
7-02809 5A

Method for the Determination of Mercury in iments by the Automated Cold Vapor mic Absorption Technique after Digestion,
7-02811 5A

w Automated Colorimetric Method for the ermination of Chloride Using Chromotropic d,
7-02812 5A

lysis of Emissions from Outboard Two le Marine Engines,
7-02823 5B

ironmental Stressor Matrix System for ly Warning,
7-02837 5A

ablishing Environmental Priorities for thetic Organic Chemicals: Focusing on the t PCBs,
7-02839 5A

lysis and GC-MS Characterization of Tox-ene in Fish and Water,
7-03005 5A

romuscular Function and Acetylcholin-erase in the Pectoral Abductor Muscle of ge-Mouth Bass (Micropterus Salmoides) as denced by the Effects of Diisopropyl-rophosphate,
7-03028 5C

iew Towed Underwater Camera System for e-Range Benthic Surveys,
7-03030 7B

ANIMAL BEHAVIOR
Effects of Water Temperature and Housing Conditions Upon the Aggressive Behavior of the Lobster Homarus Americanus,
W77-03050 5C

ANIMAL DISEASES
Edwardsiella Tarda from an Epizootic of Mullets (Mugil Cephalus) in Okitsu Bay, (In Japanese),
W77-02718 5C

ANIMAL PATHOLOGY
Methyl Mercury and the Metabolic Responses of Brain Tissue,
W77-03018 5C

ANIMAL PHYSIOLOGY
Methyl Mercury and the Metabolic Responses of Brain Tissue,
W77-03018 5C

Response of Two Arctic Amphipods, Gammarus Zaddachi and Boeckosimus (Onisimus) Affinis to Variations in Temperature and Salinity,
W77-03019 5C

ANION ADSORPTION
Adsorption of Copper and Cobalt from Fresh and Marine Systems,
W77-02645 5B

ANNELIDS
Toxicity of Water-Soluble Fractions of Four Test Oils for the Polychaetous Annelids, Neanthes Arenaceodentata and Capitella Capitata,
W77-02716 5C

ANNUAL
Annual Dynamics of Soluble Salts in the Soils of an Irrigated Field with Both Deep Closed and Open Drainage at the Bagaevsko-Sadkovskaya Irrigation System, (In Russian),
W77-02930 3F

ANTIFOULING MATERIALS
The Manufacture and Use of Selected Alkyltin Compounds, Task II,
W77-02634 5B

ANTIMONY
Literature Study of Selected Potential Environmental Contaminants, Antimony and Its Compounds,
W77-02629 5C

ANTIMONY COMPOUNDS
Literature Study of Selected Potential Environmental Contaminants, Antimony and Its Compounds,
W77-02629 5C

ANTITRANSPIRANTS
Conserving Water by Antitranspirant Treatment of Phreatophytes,
W77-02863 3B

Aerial Spraying of Phreatophytes with Antitranspirant,
W77-02867 3B

APPALACHIAN MOUNTAIN REGION
Extensive Overburden Potentials for Soil and Water Quality,
W77-03008 5B

APPLICATION FACTOR
Standard Test Fish Development. Part II: Chronic Toxicity of Guthion to the Fathead Minnow (Pimephales Promelas Refinesque),
W77-03003 5A

APPLICATION METHODS
Distribution of Water and Ions in Soils Irrigated and Fertilized from a Trickle Source,
W77-02855 3F

Conserving Water by Antitranspirant Treatment of Phreatophytes,
W77-02863 3B

Aerial Spraying of Phreatophytes with Antitranspirant,
W77-02867 3B

AQUARIA
Two Devices for Removing Supersaturating Gases in Aquarium Systems,
W77-02706 5G

AQUATIC ALGAE
Methods of Investigating Phytobenthos of Continental Water Bodies, (In Russian),
W77-02742 5A

AQUATIC ANIMALS
Cadmium in an Aquatic Ecosystem: Distribution and Effects,
W77-03009 5B

AQUATIC BUFFER ZONE
Maryland Uplands Natural Areas Study. Vol II: Eastern Shore Field Notebook,
W77-02691 2L

AQUATIC BUFFER ZONES
Maryland Uplands Natural Areas Study. Vol I: Eastern Shore,
W77-02690 2L

AQUATIC ECOLOGICAL SURVEY
Results from Aquatic Ecological Surveys at Newport Army Ammunition Plant, Newport, Indiana,
W77-03015 5C

AQUATIC ECOSYSTEMS
Water Measurement and Monitoring in Energy Developing Areas,
W77-02653 5G

AQUATIC ENVIRONMENT
Pesticide Residue Analysis in Water (103.1), Training Manual,
W77-02624 5A

Water Measurement and Monitoring in Energy Developing Areas,
W77-02653 5G

AQUATIC HABITATS
Impacts of Construction Activities in Wetlands of the United States,
W77-03007 5C

Production by Brook Trout (Salvelinus Fontinalis) in Four Streams in the Matamek Watershed, Quebec,
W77-03020 5C

AQUATIC INSECTS
Method of Marking Aquatic Coleoptera, (In French),
W77-02920 7B

The Effect of River Fluctuations Resulting from Hydroelectric Peaking on Selected Aquatic Invertebrates and Fish,
W77-03000 5G

The Emergence of Insects from a British River Warmed by Power Station Cooling-Water. Part I. The Use and Performance of Insect Emergence Traps in a Large, Spate-River and the

Effects of Various Factors on Total Catches, Upstream and Downstream of the Cooling-Water Outfalls,
W77-03043 5C

The Emergence of Insects from a British River, Warmed by Power Station Cooling-Water. Part II. The Emergence Patterns of Some Species of Ephemeroptera, Trichoptera, and Megaloptera in Relation to Water Temperature and River Flow, Upstream and Downstream of the Cooling-Water Outfalls,
W77-03044 5C

AQUATIC POPULATIONS
A Sequential Approach to the Counting of Plankton Organisms,
W77-02721 7B

Plankton Investigations Near Flevo Power Station,
W77-02726 5C

Macrozoobenthic Species Assemblages of Southeastern Lake Michigan, U.S.A.,
W77-02728 2H

AQUEOUS SOLUTIONS
Aqueous Ammonia Equilibrium Calculations: Effects of PH and Temperature,
W77-02720 5C

AQUICULTURE
Pollution Aspects of Catfish Production - Review and Projections,
W77-02626 5C

Marine Polyculture Based on Natural Food Chains and Recycled Wastes,
W77-02662 5C

Lesions Associated with Chronic Exposure to Ammonia,
W77-02693 5C

Purging a Muddy-Earthy Flavor Taint from Rainbow Trout (Salmo Gairdneri) by Transferring to Artificial and Natural Holding Environments,
W77-03023 5G

AQUIFER CHARACTERISTICS
Digital-Simulation Model of the Wenonah-Mount Laurel Aquifer in the Coastal Plain of New Jersey,
W77-02975 2F

An Appraisal of Ground Water for Irrigation in the Appleton Area, West-Central Minnesota,
W77-02982 4B

Ground-Water Resources of Wilson County, North Carolina,
W77-02984 2F

Major Aquifers in Hand and Hyde Counties, South Dakota,
W77-02992 4B

AQUIFER SYSTEMS
Finite-State Models of Transport Phenomena in Hydrologic Systems,
W77-02865 2F

AQUIFERS
Water Under the Sand,
W77-02852 4B

ARCTIC
Response of Two Arctic Amphipods, Gammarus Zaddachi and Boeckosimus (Onisimus) Affinis to Variations in Temperature and Salinity,
W77-03019 5C

ARCTIC OCEAN
The Arctic Coastal Environment of Alaska. Vol. II: A Compilation and Review of Scientific Literature of the Arctic Marine Environment,
W77-02665 5C

ARID LANDS
Crop Production in the Arid Zone with Special Reference to Western Rajasthan,
W77-02869 3F

Microclimatic Patterns on the Arid Lands Ecology Reserve,
W77-02870 2B

ARIZONA
A Comparative Water Quality Analysis of Selected Recreation Lakes and Streams in the White Mountains of Arizona,
W77-02866 5B

AROCLOR
Persistence of Polychlorinated Biphenyls in the Hard-Clam (Mercenaria Mercenaria) and the Effect Upon the Distribution of these Pollutants in the Estuarine Environment,
W77-02703 5C

AROCLORS
Histopathological Effects of Pesticides and Related Chemicals on the Livers of Fishes,
W77-02695 5C

ARSENIC
Compilation of State Data for Eight Selected Toxic Substances, Vol. V, Monitoring Program Capability, Descriptor Tables,
W77-02641 5G

Levels of Arsenic and Selenium in the Great Lakes Region,
W77-02751 5A

ARSENIC COMPOUNDS
Compilation of State Data for Eight Selected Toxic Substances, Vol. V, Monitoring Program Capability, Descriptor Tables,
W77-02641 5G

Biosynthesis of Organic Arsenic Compounds in Brown Trout (Salmo Trutta),
W77-02719 5C

ARSENICALS (PESTICIDES)
Levels of Arsenic and Selenium in the Great Lakes Region,
W77-02751 5A

ARTIFICIAL LAKES
The Ecology of an Artificial Cooling Lake,
W77-02723 5C

ARTIFICIAL REDDS
Influence of Sand in Redds on Survival and Emergence of Brook Trout (Salvelinus Fontinalis),
W77-02711 2I

ARTIFICIAL SUBSTRATES
Influence of Sand in Redds on Survival and Emergence of Brook Trout (Salvelinus Fontinalis),
W77-02711 2I

ASBESTIFORM FIBRES (MINERAL)
Asbestiform Fibre Levels in Lakes Superior and Huron,
W77-02753 5B

ASBESTOS
Asbestiform Fibre Levels in Lakes Superi and Huron,
W77-02753

Procedure for Examination of Water and Se ment Samples for Total Asbestos Fibre Co by Electron Microscopy,
W77-02766

ASCOPHYLLUM SP.
Concentrations and Concentration Factors Heavy Metals in Brown Algae,
W77-02698

ASIA
Estimation of Daily Precipitation Over Ch and the USSR Using Satellite Imagery,
W77-02663

ASTERIONELLA SP.
Plankton Investigations Near Flevo Power S tion,
W77-02726

ATLANTIC COASTAL PLAIN
Atlantic Outer Continental Shelf Ene Resources: Economic Implications for L Island,
W77-02664

ATLANTIC COD
Role of Stock Biomass and Temperature Recruitment of Southern Gulf of St. Lawre Atlantic Cod, Gadus Morhua,
W77-02883

ATLANTIC OCEAN
Wave Propagation During the Ghana welling,
W77-02801

An Oilspill Risk Analysis for the North Atla Outer Continental Shelf Lease Area,
W77-02972

ATLANTIC SALMON
Zinc Uptake by Atlantic Salmon (Salmo Sa Exposed to a Lethal Concentration of Zin 3, 11 and 19 C,
W77-03021

Temperature-Induced Changes in Acute To ty of Zinc to Atlantic Salmon (Salmo Salar),
W77-03049

Regulation of Oxygen Consumption by Inci Illumination in Embryonated Ova of Atla Salmon Salmo Salar L.,
W77-03051

Abundance and Population Dynamics Parasites Infecting Atlantic Salmon (Sa Salar) in Trout Brook, New Brunsw Canada,
W77-03053

ATMOSPHERIC INVESTIGATIONS
NOAA's Activities In Energy Related M surement and Monitoring,
W77-02652

ATRAZINE
The Pathology of Pesticide Poisoning,
W77-02694

AU SABLE RIVER (MICH)
Changes in Fish Species Composition in the Sable River, Michigan from the 1920's to 19
W77-02712

USTRALIA
Effects of Soil Conservation Treatment on Runoff and Sediment Loss from a Catchment in Southwestern New South Wales, Australia,
W77-02772 4D

UTOMATIC CONTROL
Rex, A Computer Controlled Robot for in Situ Water Quality Monitoring,
W77-02814 5A

Automated Control of Trickle Irrigation in Citrus,
W77-02864 3F

UTOREGRESSION ANALYSIS
Formulas Used to Analyze Wind-Driven Currents as First-Order Autoregressive Processes,
W77-02670 2L

VOIDANCE (FISH)
Avoidance of Lime-Neutralized Iron Hydroxide Solutions by Coho Salmon in the Laboratory,
W77-02725 5C

EVERETT JORDAN LAKE (NC)
B. Everett Jordan Lake Water-Quality Study,
W77-02954 5B

ACTERIA
The Effects of Temperature on Diseases and Their Histopathological Manifestations in Fish,
W77-02692 5C

Bacterial Degradation of Polychlorinated Biphenyls II. Rate Studies,
W77-02851 5C

AGAEVSKO-SADKI (USSR)
Determination of the Critical Depth for Bagaevsko-Sadki Irrigation System, (In Russian),
W77-02928 3F

ALTIC SEA (BROMARV AREA)
Bioaccumulation of Mercury in Myoxocephalus Quadricornis (L.) (Teleostei, Cottidae) in an Unpolluted Area of the Baltic,
W77-02731 5C

ARATARIA BASIN (LA)
Barataria Basin: Salinity Changes and Oyster Distribution,
W77-02884 5C

ARKLEY LOCK (KY)
Barkley Lock Prototype Tests Cumberland River, Kentucky,
W77-02960 8B

ARNACLE LARVAE
Temperature Effects of Crude Oil in the Upper Intertidal Zone,
W77-03004 5C

ARNACLES
Temperature Effects of Crude Oil in the Upper Intertidal Zone,
W77-03004 5C

ARRIERS
Effects of Hurricane Surge Barrier on Hydraulic Environment, Jamaica Bay New York; Hydraulic Model Investigation,
W77-02966 8B

ASELINE STUDIES
Trace Hydrocarbon Analysis: The National Bureau of Standards, Prince William Sound/Northeastern Gulf of Alaska, Baseline Study,
W77-02628 5A

Freshwater Ecological Effects,
W77-02657 5G

The Arctic Coastal Environment of Alaska. Vol. II: A Compilation and Review of Scientific Literature of the Arctic Marine Environment,
W77-02665 5C

An Inventory and Study of the Lake Pontchartrain-Lake Maurepas Estuarine Complex.
W77-02671 2L

The Metula Oil Spill,
W77-02679 5C

Lake Whitefish (Corregonus Clupeaformis (Mitchill) in Southern Indian Lake, Manitoba,
W77-02821 2H

Hydrologic Studies of the U.S. Geological Survey Related to Coal Development in Colorado.
W77-02970 5G

Reproduction of White Perch in the Lower Hudson River,
W77-03058 2L

BASELINE STUDY
The EPA Research Program on the Freshwater Ecological Effects of Energy Development and Use,
W77-02658 5G

BASIC DATA COLLECTIONS
Compilation of State Data for Eight Selected Toxic Substances. Volume II, Directory of State Toxic Substances Monitoring Agencies,
W77-02642 5G

Environmental Inventory and Assessment of Navigation Pools 24, 25, 26, Upper Mississippi and Lower Illinois Rivers: An Aquatic Analysis,
W77-02826 5A

BASS
Neuromuscular Function and Acetylcholin-Esterase in the Pectoral Abductor Muscle of Large-Mouth Bass (Micropterus Salmoides) as Evidenced by the Effects of Diisopropyl-fluorophosphate,
W77-03028 5C

BAYS
Oregons's Estuaries,
W77-02593 2L

Biscayne Bay and its Environs. An Analysis of Its Present and Future Uses for Metropolitan Dade County,
W77-02680 5G

Sediment Dispersal Patterns as Clues to Placer-like Platinum Accumulation in and Near Chagvan Bay, Alaska,
W77-02681 5B

BEACH NOURISHMENT
Beach Nourishment Techniques; Report 1, Dredging Systems for Beach Nourishment from Offshore Sources,
W77-02965 2J

BEACHES
Beach Nourishment Techniques; Report 1, Dredging Systems for Beach Nourishment from Offshore Sources,
W77-02965 2J

BEHAVIOR
Effects of Crude Oil on Marine Invertebrates,
W77-02627 5C

BELGIUM
Quantitative Relations Between the Bryophytes of the Belgian Part of the River Sambre and their Frequency of Emersion: Vertical Distribution and Influence of Pollution, (In French),
W77-03038 5B

BENTHIC FAUNA
Toxicity of Water-Soluble Fractions of Four Test Oils for the Polychaetous Annelids, Neanthes Arenaceodentata and Capitella Capitata,
W77-02716 5C

The Biology and Chemistry of a Warm-Water Stream,
W77-03010 5C

BENTHIC FAUNAL
Macrozoobenthic Species Assemblages of Southeastern Lake Michigan, U.S.A.,
W77-02728 2H

BENTHIC ORGANISMS
Comparison of 115m Cd Accumulation from Sediments and Sea Waters by Polychaete Worms,
W77-02717 5B

BENTHOS
Toxicity of Water-Soluble Fractions of Four Test Oils for the Polychaetous Annelids, Neanthes Arenaceodentata and Capitella Capitata,
W77-02716 5C

The Ecology of an Artificial Cooling Lake,
W77-02723 5C

Macrozoobenthic Species Assemblages of Southeastern Lake Michigan, U.S.A.,
W77-02728 2H

Methods of Investigating Phytobenthos of Continental Water Bodies, (In Russian),
W77-02742 5A

A Benthic Survey of Flat Creek and the Salt River Near Thayne, Wyoming.
W77-02807 5C

The Biomass and Production of the Macrobenthos of the Middle Course of the Saale River, (In German),
W77-02912 5C

Results from Aquatic Ecological Surveys at Newport Army Ammunition Plant, Newport, Indiana,
W77-03015 5C

Production by Brook Trout (Salvelinus Fontinalis) in Four Streams in the Matamek Watershed, Quebec,
W77-03020 5C

A New Towed Underwater Camera System for Wide-Range Benthic Surveys,
W77-03030 7B

BENZARTHRACENE
The Environmental Fate of Selected Poly-Nuclear Aromatic Hydrocarbons,
W77-02625 5B

BENZOPYRENE
The Environmental Fate of Selected Poly-Nuclear Aromatic Hydrocarbons,
W77-02625 5B

BERYLLIUM
Compilation of State Data for Eight Selected Toxic Substances, Vol. V, Monitoring Program Capability, Descriptor Tables,
W77-02641 5G

BIBLIOGRAPHIES
The Environmental Fate of Selected Poly-Nuclear Aromatic Hydrocarbons,
W77-02625 5B

Literature Study of Selected Potential Environmental Contaminants, Antimony and Its Compounds,
W77-02629 5C

Investigation of Selected Potential Environmental Contaminants: Haloethers,
W77-02643 5C

Molybdenum: A Toxcological Appraisal,
W77-02647 5C

The Arctic Coastal Environment of Alaska. Vol. II: A Compilation and Review of Scientific Literature of the Arctic Marine Environment,
W77-02665 5C

Advanced Wastewater Technology, A Selective Coded Bibliography,
W77-02741 5D

BIBLIOGRAPHY
Cadmium in the Environment - III: A Toxicological and Epidemiological Appraisal,
W77-02633 5B

BINDING SITES
Lead Uptake in two Marine Phytoplankton Organisms,
W77-02708 5C

BIOACCUMULATION
Persistence of Polychlorinated Biphenyls in the Hard-Clam (Mercenaria Mercenaria) and the Effect Upon the Distribution of these Pollutants in the Estuarine Environment,
W77-02703 5C

DDE and Lindane in a Large-Scale Model Lentic Ecosystem,
W77-02713 5C

Bioaccumulation of Mercury in Myoxocephalus Quadricornis (L.) (Teleostei, Cottidae) in an Unpolluted Area of the Baltic,
W77-02731 5C

Zinc Uptake by Atlantic Salmon (Salmo Salar) Exposed to a Lethal Concentration of Zinc at 3, 11 and 19 C,
W77-03021 5C

BIOASSAY
Residual Toxicity of Ozonized Seawater to Oyster Larvae,
W77-02630 5C

The Pathology of Pesticide Poisoning,
W77-02694 5C

Histopathological Effects of Pesticides and Related Chemicals on the Livers of Fishes,
W77-02695 5C

Persistence of Polychlorinated Biphenyls in the Hard-Clam (Mercenaria Mercenaria) and the Effect Upon the Distribution of these Pollutants in the Estuarine Environment,
W77-02703 5C

Lead Uptake in two Marine Phytoplankton Organisms,
W77-02708 5C

Toxicity of Water-Soluble Fractions of Four Test Oils for the Polychaetous Annelids, Neanthes Arenaceodentata and Capitella Capitata,
W77-02716 5C

Some Environmental and Toxicological Aspects of Tri-Aryl Phosphate Synthetic Oil,
W77-02724 5C

Chlorine-Containing Stable Organics: New Compounds of Environmental Concern,
W77-02727 5C

Concentrations of Copper, Iron, Lead, Nickel and Zinc in Freshwater Algal Blooms,
W77-02813 5A

Standard Test Fish Development. Part I. Fat-Head Minnows (Pimephales Promelas) and Goldfish (Carassius Auratus) as Standard Fish in Bioassays and their Reaction to Potential Reference Toxicants,
W77-03002 5A

Standard Test Fish Development. Part II: Chronic Toxicity of Guthion to the Fathead Minnow (Pimephales Promelas Refinesque),
W77-03003 5A

Toxaphene Effects on Reproduction, Growth, and Mortality of Brook Trout,
W77-03017 5C

Zinc Uptake by Atlantic Salmon (Salmo Salar) Exposed to a Lethal Concentration of Zinc at 3, 11 and 19 C,
W77-03021 5C

Physiological Responses of Rainbow Trout (Salmo Gairdneri) to Electroshock,
W77-03026 5C

Sublethal Effect of 5-Chlorouracil on Carp (Cyprinus Carpio) Larvae,
W77-03031 5C

BIOASSAYS
Biochemical Effects of Methylmercuric Chloride, Cadmium Chloride, and Lead Nitrate on Embryos and Alevins of the Brook Trout, Salvelinus Fontinalis,
W77-02732 5C

BIOCHEMICAL OXYGEN DEMAND
Chemical Pulping,
W77-02606 5B

Sampling and Analysis of Stormwater Runoff from Urban and Semi-Urban/Rural Watersheds - Systematic Development of Methodologies in Planning Urban Water Resources for Medium Size Communities,
W77-02995 5B

BIOCHEMISTRY
Comparative Methylation Chemistry of Platinum, Palladium, Lead, and Manganese,
W77-02623 5A

Aspects of Carbon Metabolism in Filamentous Marine Fungi,
W77-02638 5C

Polyhalogenated Monoterpenes from the Red Alga, Plocamium Cartilagineum,
W77-02734 5C

Physiological Responses of Rainbow Trout (Salmo Gairdneri) to Electroshock,
W77-03026 5C

Neuromuscular Function and Acetylcholin-Esterase in the Pectoral Abductor Muscle of Large-Mouth Bass (Micropterus Salmoides) as Evidenced by the Effects of Diisopropyl-fluorophosphate,
W77-03028 5C

BIOCIDES
The Manufacture and Use of Selected Alkyltin Compounds, Task II,
W77-02634 5B

BIODEGRADATION
Aspects of Carbon Metabolism in Filamentous Marine Fungi,
W77-02638 5C

Bacterial Degradation of Polychlorinated Biphenyls II. Rate Studies,
W77-02851 5C

BIODEGRADATION DECOMPOSING ORGANIC MATTER
Plankton Photosynthesis and Degradation in the Kapchagai Reservoir in the Third Year of its Existence, (In Russian),
W77-02737 5C

BIOINDICATORS
Concentrations and Concentration Factors of Heavy Metals in Brown Algae,
W77-02698 5A

Toxicity of Water-Soluble Fractions of Four Test Oils for the Polychaetous Annelids, Neanthes Arenaceodentata and Capitella Capitata,
W77-02716 5C

Selection of Strains in Investigations for Hygienic Standardization of the Bacterial Composition of Drinking Water, (In Russian),
W77-02900 5C

BIOLOGICAL COMMUNITIES
A Sequential Approach to the Counting of Plankton Organisms,
W77-02721 7B

Macrozoobenthic Species Assemblages of Southeastern Lake Michigan, U.S.A.,
W77-02728 2H

A Lakewide Study of Phytoplankton Biomass and its Species Composition in Lake Erie, April-December 1970,
W77-03039 5C

BIOLOGICAL MEMBRANES
Cellular Effects of Mercury on Fish Kidney Tubules,
W77-02696 5C

BIOLOGICAL TREATMENT
Aerobic and Anaerobic Microbial Treatment Alternatives for Shellfish Processing Wastewaters in Continuous Culture,
W77-02599 5D

Eighth Meeting of the IULTCS Tannery Wastes Commission, Svendborg, Denmark, 21st to 23rd May 1975.
W77-02603 5D

Biological Process for Effluent and Waste Treatment as Applied in the Paper Industry,
W77-02607 5D

The Microbial Degradation of Oil in Continuous Culture,
W77-03012 5B

BIOMASS
Methods of Investigating Phytobenthos of Continental Water Bodies, (In Russian),
W77-02742 5A

Evaluation of the Phytoplankton Biomass in Lakes of the World, (In Russian),
W77-02816 2H

Problems in the Monitoring of Biomass,
W77-02818 5A

The Biomass and Production of the Macrobenthos of the Middle Course of the Saale River, (In German),
W77-02912 5C

Study of Periphyton Productivity in the Novosibirsk Reservoir, (In Russian),
W77-02915 5C

A Lakewide Study of Phytoplankton Biomass and its Species Composition in Lake Erie, April-December 1970,
W77-03039 5C

ORHYTHMS
Investigation of the Salmon (Salmo Salar) Smolt Migration of the Big Salmon River, New Brunswick, 1966-72,
W77-03059 5C

OSYNTHESIS
Biosynthesis of Organic Arsenic Compounds in Brown Trout (Salmo Trutta),
W77-02719 5C

SCAYNE BAY (FLA)
Biscayne Bay and its Environs. An Analysis of its Present and Future Uses for Metropolitan Dade County,
W77-02680 5G

ACK BODY EFFECT
Temperature Effects of Crude Oil in the Upper Intertidal Zone,
W77-03004 5C

EACHING WASTES
Some Internal Measures for Reducing Effluent Load, for Example, in a Calcium Bisulfite Mill Einige innerbetriebliche Massnahmen zur Verminderung der Vorfluterbelastung, dargestellt am Beispiel einer Calciumbisulfitfabrik),
W77-02576 5D

Some Internal Measures for the Reduction of the Effluent Load Shown by the Example of a Calcium-Bisulphite Pulpmill Einigeinnerbetriebliche Massnahmen zur Verminderung der Verfluterbelastung, dargestellt am Beispiel einer Calciumbisulfitfabrik),
W77-02609 5D

ECKOSIMUS (ONISIMUS) AFFINIS
Response of Two Arctic Amphipods, Gammarus Zaddachi and Boeckosimus (Onisimus) Affinis to Variations in Temperature and Salinity,
W77-03019 5C

GS
Stratigraphy and History of Development of the Voitovtsovsk Bog in the Vinnitsa Oblast, (In Ukrainian),
W77-02922 2H

TTOM SEDIMENTS
Spatial and Temporal Variations in the Interstitial Water Chemistry of Chesapeake Bay Sediments,
W77-02808 5C

Biologically Active Substances of the Silt Deposits of Dnieper Reservoirs, (In Russian),
W77-02934 5B

Content of Lithium, Uranium and Thorium in Mineral Springs of the Nakhichevan ASSR, (In Russian),
W77-03016 5A

BRAIN ENERGY METABOLISM
Methyl Mercury and the Metabolic Responses of Brain Tissue,
W77-03018 5C

BREAKWATERS
Stability of Rubble-Mound Breakwater Lahaina Harbor, Hawaii; Hydraulic Model Investigation,
W77-02940 8B

Transmission of Wave Energy through and Overtopping of the Long Beach, California, Breakwater; Hydraulic Model Investigation,
W77-02945 8B

Design for Wave Protection, Flood Control, and Prevention of Shoaling, Cattaraugus Creek Harbor, New York; Hydraulic Model Investigation,
W77-02952 8B

BREEDING
Bloodsucking Mosquitoes (Diptera, Culicidae) of the White Sea Coast: III. Breeding Places of Mosquitoes of the Genus Aedes, (In Russian),
W77-02699 5G

BROMIDES
Sampling and Analysis of Selected Toxic Substances. Task II-Ethylene Dibromide,
W77-02644 5A

BROMINE
Sampling and Analysis of Selected Toxic Substances. Task II-Ethylene Dibromide,
W77-02644 5A

Polyhalogenated Monoterpenes from the Red Alga, Plocamium Cartilagineum,
W77-02734 5C

BROOK TROUT
Influence of Sand in Redds on Survival and Emergence of Brook Trout (Salvelinus Fontinalis),
W77-02711 2I

Changes in Fish Species Composition in the Au Sable River, Michigan from the 1920's to 1972,
W77-02712 5C

Biochemical Effects of Methylmercuric Chloride, Cadmium Chloride, and Lead Nitrate on Embryos and Alevins of the Brook Trout, Salvelinus Fontinalis,
W77-02732 5C

Analysis and GC-MS Characterization of Toxaphene in Fish and Water,
W77-03005 5A

Toxaphene Effects on Reproduction, Growth, and Mortality of Brook Trout,
W77-03017 5C

Production by Brook Trout (Salvelinus Fontinalis) in Four Streams in the Matamek Watershed, Quebec,
W77-03020 5C

BROWN TROUT
Changes in Fish Species Composition in the Au Sable River, Michigan from the 1920's to 1972,
W77-02712 5C

Biosynthesis of Organic Arsenic Compounds in Brown Trout (Salmo Trutta),
W77-02719 5C

BULGARIA
The Erosion Index as a Factor for Determining Turbidity in Rivers (L'Indice D'Erosion-Facteur de Determination de la Turbidite des Rivieres),
W77-02773 2J

BULK DENSITY
A Compaction Apparatus for the Preparation of Soil Cores of Different Bulk Densities and Thicknesses,
W77-03067 2G

BURNHAM CREEK WATERSHED (MINN)
A Water-Quality Assessment of the Burnham Creek Watershed, Polk County, Minnesota,
W77-02979 5B

CADDIS FLIES
The Ecology of Caddis Flies (Trichoptera) from Mountain Streams of Southern Tien-Shan (Exemplified by the Fauna of the Ak-Bura River), (In Russian),
W77-02892 2I

CADMIUM
Cadmium in the Environment - III: A Toxicological and Epidemiological Appraisal,
W77-02633 5B

Compilation of State Data for Eight Selected Toxic Substances, Vol. V, Monitoring Program Capability, Descriptor Tables,
W77-02641 5G

Comparison of 115m Cd Accumulation from Sediments and Sea Waters by Polychaete Worms,
W77-02717 5B

Cadmium in an Aquatic Ecosystem: Distribution and Effects,
W77-03009 5B

Water Hyacinths for Removal of Cadmium and Nickel from Polluted Waters,
W77-03041 5G

CADMIUM ANALYSIS
Cadmium in the Environment - III: A Toxicological and Epidemiological Appraisal,
W77-02633 5B

CADMIUM CHLORIDE
Biochemical Effects of Methylmercuric Chloride, Cadmium Chloride, and Lead Nitrate on Embryos and Alevins of the Brook Trout, Salvelinus Fontinalis,
W77-02732 5C

CALCINATION
Chromium Recovery from Sludges Produced from Chromate-Inhibited Cooling Water,
W77-02874 5D

CALCIUM
Physiological Assessment of Calcium Content in Distilled Drinking Water, (In Russian),
W77-02909 5F

CALCIUM COMPOUNDS
Distributions and Natural Levels of Related Metals in a Trophic Pathway,
W77-02646 5B

CALIFORNIA
Effects of Water Quality on Larval Settlements in Los Angeles Harbor as Determined by Multivariate Statistical Techniques,
W77-02735 5C

CALIFORNIA

Transmission of Wave Energy through and Overtopping of the Long Beach, California, Breakwater; Hydraulic Model Investigation,
W77-02945 8B

Numerical Analysis of Tidal Circulation for Long Beach Harbor; Report 1, Existing Conditions and Alternate Plans for Pier J Completion and Tanker Terminal Study,
W77-02948 8B

Numerical Analysis of Tidal Circulation for Long Beach Harbor; Report 3, Existing Conditions and Alternate Plans for Pier J Completion and Tanker Terminal Study with -82 Ft Channel,
W77-02949 8B

Long Beach Harbor Numerical Analysis of Harbor Oscillations; Report 1, Existing Conditions and Proposed Improvements,
W77-02950 8B

Long Beach Harbor Numerical Analysis of Harbor Oscillations; Report 3, Alternate Plans for Pier J Completion and Tanker Terminal Project (62- and 82-Ft Depths),
W77-02951 8B

Los Angeles and Long Beach Harbors Model Study; Report 3, Analyses of Wave and Ship Motion Data,
W77-02955 8B

A Reconnaissance of the Effects of a Forest Fire on Water Quality in Kings Canyon National Park, California,
W77-02973 5B

Surface Water Supply of the United States, 1966-70: Part 11. Pacific Slope Basins in California--Volume 3. Southern Central Valley Basins.
W77-02981 7C

Adaptation to Increasing Salinity of the Colorado River,
W77-02997 3C

Impact of Urbanization on Water Yield, Flood Peak Sediment Yield, and Water Quality in the Berkeley Hills, California,
W77-02999 4C

Temperature Effects of Crude Oil in the Upper Intertidal Zone,
W77-03004 5C

CAMERAS

A New Towed Underwater Camera System for Wide-Range Benthic Surveys,
W77-03030 7B

CAMPECHE BAY (MEX)

Nycthemeral Variation of the Phytoplankton in Campeche Bay, Mexico, (In Spanish),
W77-02854 5C

CAMPING

Effects of Recreation on Water Quality in Wildlands,
W77-02590 5C

A Comparative Water Quality Analysis of Selected Recreation Lakes and Streams in the White Mountains of Arizona,
W77-02866 5B

CANADA

Quebec Environmental Regulations in the Textile Industry...And One Company's Solution,

Waterlogging in an Alluvial Aquifer Near Lake Minnequa, Pueblo, Colorado,
W77-02983 2F

Digital Ground-Water Model of the Ogallala Aquifer in Parts of Washington and Yuma Counties, Northern High Plains of Colorado,
W77-02991 4B

COLORADO FRONT RANGE
Effects of Recreation on Water Quality in Wildlands.
W77-02590 5C

COLORADO RIVER
Corrosion of Selected Materials in Lake Mead Water,
W77-02832 8G

COLORADO RIVER BASIN
Colorado River Basin Pilot Project, Comprehensive Evaluation Report, Five Winter Seasons 1970-71 to 1974-75,
W77-03060 3B

COLORIMETRY
New Automated Colorimetric Method for the Determination of Chloride Using Chromotropic Acid,
W77-02812 5A

COLUMBIA RIVER
Observations on Gas Bubble Disease Among Wild Adult Columbia River Fishes,
W77-02705 5C

COMBINED SEWERS
Effect of Storage on Storm and Combined Sewers,
W77-02746 5D

Pilot Scale Evaluation of a Physical-Chemical Wastewater Treatment System for Combined Sewer Overflows.
W77-02757 5D

Practices, Policies and Technology of Storm and Combined Sewers in Foreign Countries.
W77-02767 5G

Measures to Counteract Daily Water Pollution: Development Tendencies in .USA, (In Swedish),
W77-03035 5D

COMBUSTION
Controlled Combustion Tests Carried Out Near Rimouski,
W77-02759 5E

COMMERCIAL FISH FOODS
Purging a Muddy-Earthy Flavor Taint from Rainbow Trout (Salmo Gairdneri) by Transferring to Artificial and Natural Holding Environments,
W77-03023 5G

COMPETITION
Distribution of Fish Species in Great Bear Lake, Northwest Territories, with Reference to Zooplankton, Benthic Invertebrates, and Environmental Conditions,
W77-03055 5C

COMPREHENSIVE PLANNING
Proceedings of Seminar Sessions on State Water Supply Planning, Sept. - Oct. 1975, (Executive Summary).
W77-02618 6B

Proceedings of Seminar Sessions on State Water Supply Planning (Sept.-Oct. 1975).
W77-02619 6B

COMPRESSIVE STRENGTH
Strain Rate Effect on the Strength of Frozen Silt,
W77-02804 8D

COMPUTER MODELS
Ecological Modeling and Estimation of Stress,
W77-02622 5C

Hydrodynamics-Dispersion Studies in Storm Sewers,
W77-02827 8B

Water Quality Effect of Diking a Shallow Arid-Region Lake,
W77-02871 5C

Digital-Simulation Model of the Wenonah-Mount Laurel Aquifer in the Coastal Plain of New Jersey,
W77-02975 2F

Digital Ground-Water Model of the Ogallala Aquifer in Parts of Washington and Yuma Counties, Northern High Plains of Colorado,
W77-02991 4B

COMPUTER PROGRAMS
Computer-Aided Planning of Regional Sludge Disposal Systems, User's Manual,
W77-02745 5D

Computerized Scheme for the Identification of Aeromonads and Members of the Family Enterobacteriaceae,
W77-02758 5A

Rex, A Computer Controlled Robot for in Situ Water Quality Monitoring,
W77-02814 5A

Discharge Computations at River Control Structures,
W77-02986 4A

CONCRETES
Performance of Lignite and Subbituminous Fly Ash in Concrete - A Progress Report,
W77-02803 8F

CONFERENCES
Effects of Man on the Interface of the Hydrological Cycle with the Physical Environment.
W77-02771 4D

U.S. Army Corps of Engineers Fourth Hydrographic Survey Conference, 5-6 November 1975,
W77-02937 8B

CONSERVATION
Assatoague Marine Sanctuary: A Case Study,

W77-02844 5G

OST-RISK BENEFIT ANALYSIS
A Cost-Risk-Benefit Analysis of Toxic Substances,
W77-02844 5G

OTTUS COGNATUS
Upper Lethal and Preferred Temperatures of the Slimy Sculpin, Cottus Cognatus,
W77-03025 5C

OWANESQUE RIVER (PENN)
Chute Spillway for Cowanesque Dam Cowanesque River, Pennsylvania; Hydraulic Model Investigation,
W77-02959 8B

ROP PRODUCTION
Seasonal Water Use of Irrigated Pasture Grasses Under Permanently-Set Irrigation as Related to Climatic Factors,
W77-02834 3F

Crop Production in the Arid Zone with Special Reference to Western Rajasthan,
W77-02869 3F

The Productiveness of Loess Soils of Different Degrees of Erosion, (In German),
W77-02891 3F

Adaptation to Increasing Salinity of the Colorado River,
W77-02997 3C

ROP RESPONSE
The Productiveness of Loess Soils of Different Degrees of Erosion, (In German),
W77-02891 3F

Yield Response of Alfalfa Cultivars and Clones to Several pH Levels in Tatum Subsoil,
W77-03075 3F

RUSTACEA
Effects of Crude Oil on Marine Invertebrates,
W77-02627 5C

RUSTACEANS
Temperature Effects of Crude Oil in the Upper Intertidal Zone,
W77-03004 5C

RYPTOCARYA ALBA
Comparative Morphological and Ecophysiological Aspects of Two Sclerophyllous Chilean Shrubs,
W77-02858 3B

ULTIVATED LANDS
Structural Composition and Some Problems of the Water Regime of Dark-Chestnut Soils of the Kustanai Oblast in Connection with the Duration of their Cultivation, (In Russian),
W77-02853 2G

ULVERTS
Stratified Flow in Great Salt Lake Culvert,
W77-02987 8B

UMBERLAND PLATEAU (TENN)
Mapping and Measuring Land-Cover Characteristics of New River Basin, Tennessee, Using Landsat Digital Tapes,
W77-02978 4A

UMBERLAND RIVER (KY)
Barkley Lock Prototype Tests Cumberland River, Kentucky,
W77-02960 8B

CURRENTS (WATER)
Hydraulic Characteristics of Rigolets Pass, Louisiana, Hurricane Surge Control Structures; Hydraulic Model Investigation,
W77-02932 8B

Effects of 40-Foot Charleston Harbor Project on Tides, Currents and Salinities; Hydraulic Model Investigation,
W77-02947 8B

CUYAHOGA RIVER (OHIO)
Observations of the Kelvin-Helmholtz Instability in Laboratory Models and Field Examples of Thermal Plumes,
W77-02796 2H

CYANIDE
Compilation of State Data for Eight Selected Toxic Substances, Vol. V, Monitoring Program Capability, Descriptor Tables,
W77-02641 5G

CYANIDES
Modification of the Traditional Sequence for the Treatment of Wastewaters from Metal Finishing Installations,
W77-02762 5D

CYANOPHYTA
Identification of Acid-Containing Fraction of Odorants of Natural Water, (In Russian),
W77-02901 5A

Fidelity of Thermophilic Blue-Green Algae to Hot Spring Habitats,
W77-03045 5C

CYCLING NUTRIENTS
Excretion of Ammonia and Inorganic Phosphorous by Euphausia Pacifica and Metridia Pacifica at Different Concentrations of Phytoplankton,
W77-03036 5C

CYTOLOGICAL STUDIES
Cellular Effects of Mercury on Fish Kidney Tubules,
W77-02696 5C

CZECHOSLOVAKIA
Water Resource Management in the Czechoslovakian Paper Industry During the Fifth Five-Year Plan Period (Vodni hospodarstvi papirenskeho prumyslu CSR v pate petiletce),
W77-02578 3E

Fluorine in Drinking Water of Eastern Slovakia, (In Russian),
W77-03056 5A

DAIRY INDUSTRY
Application of Ultra Filtration/Reverse Osmosis Technique for the Fractionation of Cheese Whey - A Waste Disposal of the Dairy Industry,
W77-02598 5D

DAIRY WASTES
A Benthic Survey of Flat Creek and the Salt River Near Thayne, Wyoming.
W77-02807 5C

DAMS
Development of Navigation with Locks and Dams,
W77-02943 8B

Chute Spillway for Cowanesque Dam Cowanesque River, Pennsylvania; Hydraulic Model Investigation,
W77-02959 8B

DANUBE RIVER BASIN
The Growth and Yield of Poplar Cultures Under Watering and Fertilization Conditions, (In Bulgarian),
W77-03040 3F

DAPHNIA
Chlorine-Containing Stable Organics: New Compounds of Environmental Concern,
W77-02727 5C

DATA COLLECTION
Compilation of State Data for Eight Selected Toxic Substances, Vol. V, Monitoring Program Capability, Descriptor Tables,

DENSITY CURRENTS
Stratified Flow in Great Salt Lake Culvert,
W77-02987 8B

DEPTH
Determination of the Critical Depth for Bagaevsko-Sadki Irrigation System, (In Russian),
W77-02928 3F

DESALINATION
Solar Distillation in Chile,
W77-02862 3A

Experimental, Clinical and Physiological Data for Substantiating the Lower Limits of the Mineralization of Desalinated Drinking Water, (In Russian),
W77-02895 5C

Physiological Assessment of Calcium Content in Distilled Drinking Water, (In Russian),
W77-02909 5F

Study of the Effect of Desalted Drinking Water on the Health of the Population, (In Russian),
W77-03037 5F

DESALINATION APPARATUS
Solar Distillation in Chile,
W77-02862 3A

DESALINATION PLANTS
Drinking Water Supply in Krasnovodsk, (In Russian),
W77-02902 3A

DESIGN CRITERIA
Improving Design Criteria for Septic Tank Systems,
W77-02621 5D

DETERGENTS
Effect of Some Integral Components of Detergents on the Behaviour, Mortality and Damage of Gills of the Larvae of the Species Rhyacophila Fasciata Hag. (Trichoptera), (In Serbo-Croatian),
W77-02893 5C

Distinctive Features of Self-Purification of Water and Sediments of a Shallow Sea as Exemplified by the Sea of Azov, (In Russian),
W77-02897 5G

DFP
Neuromuscular Function and Acetylcholin-Esterase in the Pectoral Abductor Muscle of Large-Mouth Bass (Micropterus Salmoides) as Evidenced by the Effects of Diisopropyl-fluorophosphate,
W77-03028 5C

DIATOMS
Lead Uptake in two Marine Phytoplankton Organisms,
W77-02708 5C

Plankton Investigations Near Flevo Power Station,
W77-02726 5C

A Lakewide Study of Phytoplankton Biomass and its Species Composition in Lake Erie, April-December 1970,
W77-03039 5C

DIELDRIN
Chlorinated Hydrocarbons in Cetaceans,
W77-03033 5A

Dieldrin in the Diet of Channel Catfish (Ictalurus Punctatus): Uptake and Effect on Growth,
W77-03034 5C

DIESEL OIL
The Microbial Degradation of Oil in Continuous Culture,
W77-03012 5B

DIFFUSION
Hydrodynamics-Dispersion Studies in Storm Sewers,
W77-02827 8B

DIFFUSIVE RESISTANCE (PLANTS)
Anomalous Water Relations in Copper-Deficient Wheat Plants,
W77-02861 2I

DIGESTION
Dieldrin in the Diet of Channel Catfish (Ictalurus Punctatus): Uptake and Effect on Growth,
W77-03034 5C

DIISOPROPYLFLUOROPHOSPHATE
Neuromuscular Function and Acetylcholin-Esterase in the Pectoral Abductor Muscle of Large-Mouth Bass (Micropterus Salmoides) as Evidenced by the Effects of Diisopropyl-fluorophosphate,
W77-03028 5C

DIKES
Water Quality Effect of Diking a Shallow Arid Region Lake,
W77-02871 5C

DIMIDE
Experimental Substantiation of the Maximum Allowable Concentration of Dimide in Water Bodies, (In Russian),
W77-02907 5C

DIPTERA
The Biomass and Production of the Macrobenthos of the Middle Course of the Saale River, (In German),
W77-02912 5C

DISEASE DETECTION
Papers of a Seminar on Early Warning System for Toxic Substances, Conference Report,
W77-02835 5A

Early-Warning System for Toxic Substances-Human Health Aspects,
W77-02847 5A

DISEASE SCREENING
Papers of a Seminar on Early Warning System for Toxic Substances, Conference Report,
W77-02835 5A

Early-Warning System for Toxic Substances-Human Health Aspects,
W77-02847 5A

DISEASES
National Cancer Institute Program of Cancer Surveillance, Epidemiology and End Result Reporting (Seer Program),
W77-02843 5A

DISPERSAL PATTERNS
Sediment Dispersal Patterns as Clues to Placer-like Platinum Accumulation in and Near Chaw van Bay, Alaska,
W77-02681 5

DISPERSION
A Simple Dispersion Model of the Mean Concentration Field in the Western and Central Basins of Lake Erie,
W77-02795 2E

Hydrodynamics-Dispersion Studies in Storm Sewers,
W77-02827 8B

Feasibility of Monitoring Flow Patterns and Sediment and Pollutant Dispersion of Water Bodies with 24-Channel Spectral Data,
W77-02946 5B

Convective Model of Longitudinal Dispersion,
W77-02988 5B

Dispersion--Mississippi River Below Baton Rouge, La.,
W77-02989 5B

DISPERSION-DIFFUSION COEFFICIENTS
Hydrodynamics-Dispersion Studies in Storm Sewers,
W77-02827 8B

DISSOLVED GASES
Observations on Gas Bubble Disease Among Wild Adult Columbia River Fishes,
W77-02705 5C

Two Devices for Removing Supersaturating Gases in Aquarium Systems,
W77-02706 5C

OLVED ORGANIC MATTER
e Effect of Dissolved Organic Matter in Sea ıter on the Uptake of Mixed Individual drocarbons and Number 2 Fuel Oil by a ırine Filter-Feeding Bivalve (Mercenaria rcenaria),
77-02817 5C

OLVED OXYGEN
sions Associated with Chronic Exposure to mmonia,
77-02693 5C

fects of Water Quality on Larval Settlements Los Angeles Harbor as Determined by Mul- ariate Statistical Techniques,
77-02735 5C

mary Production and Oxygen Budget in a eam of the Central Pyrenees, (In French),
77-02916 5C

lls Lake Water-Quality Study; Hydraulic boratory Investigation,
77-02941 5B

Everett Jordan Lake Water-Quality Study,
77-02954 5B

77-03010 5C

ILLATION
inking Water Supply in Krasnovodsk, (In ssian),
77-02902 3A

RIBUTION
fects of Water Quality on Larval Settlements Los Angeles Harbor as Determined by Mul- ariate Statistical Techniques,
77-02735 5C

e Groundwater Fauna of the Saale River ainage Area (Thuringia), (In German),
77-02913 5C

stribution of Amphipoda in the Dniester tuary and its Possible Changes in Connection th the Regulation of the Dniester River, (In ssian),
77-02914 5C

aracteristics of the Distribution of Mollusks the Family Unionidae in the Kremenchug servoir, (In Russian),
77-02921 2H

ovement of Yellow Perch (Perca Flavescens) d White Sucker (Catostomus Commersoni) in Nearshore Great Lakes Habitat Subject to a ermal Discharge,
77-03027 5C

stribution of Fish Species in Great Bear ke, Northwest Territories, with Reference to oplankton, Benthic Invertebrates, and En- onmental Conditions,
77-03055 5C

RIBUTION PATTERNS
New Towed Underwater Camera System for ide-Range Benthic Surveys,
77-03030 7B

RICT OF COLUMBIA
fect of Land Development on Soil Erosion d Sediment Concentration in an Urbanizing sin,
77-02793 4C

DIVERSION
Study of Sanitary Problems in Connection with Inter-Basin Transfer of River Runoff, (In Russian),
W77-02905 5C

Cooper River Rediversion Project, Bushy Park Water Supply Tests; Hydraulic Model Investigation,
W77-02939 8B

DNIEPER RESERVOIRS (USSR)
Biologically Active Substances of the Silt Deposits of Dnieper Reservoirs, (In Russian),
W77-02934 5B

DNIESTER ESTUARY (USSR)
Distribution of Amphipoda in the Dniester Estuary and its Possible Changes in Connection with the Regulation of the Dniester River, (In Russian),
W77-02914 5C

DOLPHINS
Chlorinated Hydrocarbons in Cetaceans,
W77-03033 5A

DRAINAGE BASINS
The Groundwater Fauna of the Saale River Drainage Area (Thuringia), (In German),
W77-02913 5C

DRAWDOWN
Digital-Simulation Model of the Wenonah-Mount Laurel Aquifer in the Coastal Plain of New Jersey,
W77-02975 2F

Digital Ground-Water Model of the Ogallala Aquifer in Parts of Washington and Yuma Counties, Northern High Plains of Colorado,
W77-02991 4B

DREDGED MATERIAL
Beach Nourishment Techniques; Report 1, Dredging Systems for Beach Nourishment from Offshore Sources,
W77-02965 2J

DREDGING
Techniques for Reducing Turbidity Associated with Present Dredging Procedures and Operations,
W77-02936 5G

Beach Nourishment Techniques; Report 1, Dredging Systems for Beach Nourishment from Offshore Sources,
W77-02965 2J

DRILLING
An Oilspill Risk Analysis for the North Atlantic Outer Continental Shelf Lease Area,
W77-02972 5B

DROUGHT RESISTANCE
Metabolism of Protein and Nucleic Acids During Adaptation to Various Types of Drought, (In Russian),
W77-02926 3F

DROUGHT TOLERANCE
Metabolism of Protein and Nucleic Acids During Adaptation to Various Types of Drought, (In Russian),
W77-02926 3F

DROUGHTS
Metabolism of Protein and Nucleic Acids During Adaptation to Various Types of Drought, (In Russian),
W77-02926 3F

DRY BEDS
Successions of the Vegetation Cover on the Drying Bottom of Lake Sevan, (In Russian),
W77-02736 2H

DYSTROPHY
Temporal Variations in the Phosphorus Content of a Northern Dystrophic Lake,
W77-02824 5C

EARLY WARNING SYSTEMS
Papers of a Seminar on Early Warning Systems for Toxic Substances, Conference Report,
W77-02835 5A

EARTHQUAKE ENGINEERING
Optimization of Water Resource Systems Incorporating Earthquake Risk,
W77-02831 6A

EASTERN MONTANA GROUNDWATER
Water-Resources Data for Deep Aquifers on Eastern Montana,
W77-02985 7C

ECOLOGICAL RECOVERY
Freshwater Ecological Effects,
W77-02657 5G

ECOLOGY
Assatoague Marine Sanctuary: A Case Study,
W77-02686 6G

On the Habitability of Mars, An Approach to Planetary Ecosynthesis.

FATHEAD MINNOWS
Standard Test Fish Development. Part I. F Head Minnows (Pimephales Promelas) Goldfish (Carassius Auratus) as Standard F in Bioassays and their Reaction to Poten Reference Toxicants,
W77-03002

Standard Test Fish Development. Part Chronic Toxicity of Guthion to the Fath Minnow (Pimephales Promelas Refinesque),
W77-03003

FEDERAL WATER POLLUTION CONTROL ACT
Implications of the Water Pollution Control of 1972 for the Mineral Resources Industry Survey.
W77-02806

FEDERAL WATER POLLUTION CONTROL ACT AMENDMENTS (1972)
Municipal Wastewater Recycling: A Strat for Meeting the Zero Discharge Goal of PL 500,
W77-02620

FERRIC CHLORIDE
Phosphorus Removal Demonstration St Using Ferric Chloride and Alum at C. Uplands,
W77-02738

FERTILIZATION
The Growth and Yield of Poplar Cult Under Watering and Fertilization Conditi (In Bulgarian),
W77-03040

FERTILIZER PLACEMENT
Fertilizer or Salt Leaching as Affected by face Shaping and Placement of Fertilizer Irrigation Water,
W77-03072

FERTILIZERS
Physical and Chemical Properties of T Soils and Changes in Their Agrochemical perties After Irrigation, (In Russian),
W77-02929

Calculation of Rate of Nutrient Uptake Growing Roots,
W77-03061

Effect of Method of Nitrogen Applicatio Corn (Zea Mays L.) Grown on Irrigated S Soil,
W77-03071

Fertilizer or Salt Leaching as Affected by face Shaping and Placement of Fertilizer Irrigation Water,
W77-03072

FIBERS (ASBESTOS)
Procedure for Examination of Water and S ment Samples for Total Asbestos Fibre C by Electron Microscopy,
W77-02766

LD CHANNELS (IRRIGATION)
ield Channels: A Key to Better Indian Irriga-on,
77-03062 3F

AMENTOUS MARINE FUNGI
spects of Carbon Metabolism in Filamentous arine Fungi,
77-02638 5C

RATION
reating Effluent Containing Compounds Pref. yes - By Adding Salt Generator of Opposite harge to Effluent Ion then Ultra-Filtering.
77-02612 5D

TERS
irect Physicochemical Treatment with Ozone,
77-02747 5D

TRATION
pplication of Ultra Filtration/Reverse Osmo- Technique for the Fractionation of Cheese hey - A Waste Disposal of the Dairy Indus-y,
77-02598 5D

emoval of Toxic Chemicals from Water with ctivated Carbon,
77-02707 5D

irect Physicochemical Treatment with Ozone,
77-02747 5D

ffluent Polishing by Filtration through Ac-vated Alumina, Volume II, (March, 1975).
77-02755 5D

ITE ELEMENT ANALYSIS
umerical Modeling of Resonant Oscillations Deep Draft Harbors,
77-02935 8B

ong Beach Harbor Numerical Analysis of arbor Oscillations; Report 1, Existing Condi-ons and Proposed Improvements,
77-02950 8B

ong Beach Harbor Numerical Analysis of arbor Oscillations; Report 3, Alternate Plans r Pier J Completion and Tanker Terminal oject (62- and 82-Ft Depths),
77-02951 8B

ITE-STATE MODELS
nite-State Models of Transport Phenomena in ydrologic Systems,
77-02865 2F

LAND
ne Effectiveness of the Finnish Anti-Mercury easurements in the Moderately Polluted Area Hameenkyro, (In Finnish),
77-02733 5C

I
ne Effects of Freshwater Withdrawals on sh and Wildlife Resources,
77-02655 5G

n the Living Environment for Fish in the oastal Waters Surrounding the New and Old olcanic Island 'Nisi-No-Sima', (In Japanese),
77-02917 5C

ne Distribution and Abundance of Larval shes Along the Western Shore of Lake Erie Monroe, Michigan,
77-03011 2H

FISH BEHAVIOR
Lethal and Preferred Temperatures of the Alewife (Alosa Pseudoharengus) in Lake Michigan,
W77-02710 5C

Avoidance of Lime-Neutralized Iron Hydroxide Solutions by Coho Salmon in the Laboratory,
W77-02725 5C

Movement of Yellow Perch (Perca Flavescens) and White Sucker (Catostomus Commersoni) in a Nearshore Great Lakes Habitat Subject to a Thermal Discharge,
W77-03027 5C

Increased Opercular Rates of Pink Salmon (Oncorhynchus Gorbuscha) Fry after Exposure to the Water-Soluble Fraction of Prudhoe Bay Crude Oil,
W77-03032 5C

FISH DIETS
Dieldrin in the Diet of Channel Catfish (Ictalurus Punctatus): Uptake and Effect on Growth,
W77-03034 5C

FISH DISEASES
The Effects of Temperature on Diseases and Their Histopathological Manifestations in Fish,
W77-02692 5C

Lesions Associated with Chronic Exposure to Ammonia,
W77-02693 5C

Histopathological Effects of Pesticides and Related Chemicals on the Livers of Fishes,
W77-02695 5C

Cellular Effects of Mercury on Fish Kidney Tubules,
W77-02696 5C

Observations on Gas Bubble Disease Among Wild Adult Columbia River Fishes,
W77-02705 5C

Two Devices for Removing Supersaturating Gases in Aquarium Systems,
W77-02706 5G

Edwardsiella Tarda from an Epizootic of Mullets (Mugil Cephalus) in Okitsu Bay, (In Japanese),
W77-02718 5C

Sublethal Effect of 5-Chlorouracil on Carp (Cyprinus Carpio) Larvae,
W77-03031 5C

FISH EGGS
Influence of Sand in Redds on Survival and Emergence of Brook Trout (Salvelinus Fontinalis),
W77-02711 2I

Effect of Shear on Eggs and Larvae of Striped Bass, Morone Saxatilis, and White Perch, M. Americana,
W77-02714 5C

Viable Embryogenesis of the Winter Flounder Pseudopleuronectes Americanus from -1.8 deg to 15 deg C,
W77-03029 5C

Sublethal Effect of 5-Chlorouracil on Carp (Cyprinus Carpio) Larvae,
W77-03031 5C

FISH FARMING
Lesions Associated with Chronic Exposure to Ammonia,
W77-02693 5C

FISH HABITATS
On the Living Environment for Fish in the Coastal Waters Surrounding the New and Old Volcanic Island 'Nisi-No-Sima', (In Japanese),
W77-02917 5C

FISH LIVERS
Histopathological Effects of Pesticides and Related Chemicals on the Livers of Fishes,
W77-02695 5C

FISH MANAGEMENT
Proceedings of the Twenty-eighth Annual Gulf and Caribbean Fisheries Institute.
W77-02660 5C

Purging a Muddy-Earthy Flavor Taint from Rainbow Trout (Salmo Gairdneri) by Transferring to Artificial and Natural Holding Environments,
W77-03023 5G

FISH MIGRATION
Winter Flounder Movements, Growth, and Mortality Off Massachusetts,
W77-03052 5C

Investigation of the Salmon (Salmo Salar) Smolt Migration of the Big Salmon River, New Brunswick, 1966-72,
W77-03059 5C

FISH PARASITES
Abundance and Population Dynamics of Parasites Infecting Atlantic Salmon (Salmo Salar) in Trout Brook, New Brunswick, Canada,
W77-03053 5C

FISH PHYSIOLOGY
Lesions Associated with Chronic Exposure to Ammonia,
W77-02693 5C

Cellular Effects of Mercury on Fish Kidney Tubules,
W77-02696 5C

Effects of Turbidity on Ventilation Rates and Oxygen Consumption of Green Sunfish, Lepomis Cyanellus,
W77-02697 5C

Biosynthesis of Organic Arsenic Compounds in Brown Trout (Salmo Trutta),
W77-02719 5C

Physiological Responses of Rainbow Trout (Salmo Gairdneri) to Electroshock,
W77-03026 5C

Neuromuscular Function and Acetylcholin-Esterase in the Pectoral Abductor Muscle of Large-Mouth Bass (Micropterus Salmoides) as Evidenced by the Effects of Diisopropyl-fluorophosphate,
W77-03028 5C

Viable Embryogenesis of the Winter Flounder Pseudopleuronectes Americanus from -1.8 deg to 15 deg C,
W77-03029 5C

Increased Opercular Rates of Pink Salmon (Oncorhynchus Gorbuscha) Fry after Exposure to the Water-Soluble Fraction of Prudhoe Bay Crude Oil,
W77-03032 5C

FISH POPULATION

FISH POPULATION
Physical and Biological Effects of Thermal Discharges at La Cygne Lake, Volume I: Project Report,
W77-02616 5C

FISH POPULATIONS
Changes in Fish Species Composition in the Au Sable River, Michigan from the 1920's to 1972,
W77-02712 5C

Lake Whitefish (Corregonus Clupeaformis (Mitchill) in Southern Indian Lake, Manitoba,
W77-02821 2H

Production by Brook Trout (Salvelinus Fontinalis) in Four Streams in the Matamek Watershed, Quebec,
W77-03020 5C

FISH REPRODUCTION
The Muddy Run Pumped Storage Project: A Case History,
W77-02709 5C

Effect of Shear on Eggs and Larvae of Striped Bass, Morone Saxatilis, and White Perch, M. Americana,
W77-02714 5C

Viable Embryogenesis of the Winter Flounder Pseudopleuronectes Americanus from -1.8 deg to 15 deg C,
W77-03029 5C

Reproduction of White Perch in the Lower Hudson River,
W77-03058 2L

FISH STANDING CROP
The Marine Biological Impact of the Honolulu Generating Station,
W77-02631 5C

FISH TOXINS
Lesions Associated with Chronic Exposure to Ammonia,
W77-02693 5C

Toxicity of the Surgeon Fishes-II Properties of the Principal Water Soluble Toxin,
W77-02700 5C

FISHING GEAR
Proceedings of the Twenty-eighth Annual Gulf and Caribbean Fisheries Institute.
W77-02660 5C

FISHKILL
The Pathology of Pesticide Poisoning,
W77-02694 5C

Effect of Shear on Eggs and Larvae of Striped Bass, Morone Saxatilis, and White Perch, M. Americana,
W77-02714 5C

FLOCCULATION
The Purification of Industrial Effluent.
W77-02615 5D

FLOOD CONTROL
Design for Wave Protection, Flood Control, and Prevention of Shoaling, Cattaraugus Creek Harbor, New York; Hydraulic Model Investigation,
W77-02952 8B

FLOOD PEAK
Impact of Urbanization on Water Yield, Flood Peak Sediment Yield, and Water Quality in the Berkeley Hills, California,
W77-02999 4C

FLOODS
Storm Tide Frequency Analysis for the Open Coast of Virginia, Maryland, and Delaware,
W77-02661 2L

Effects of Flood Flows on Water Quality of Tioga-Hammond Lakes; Hydraulic Model Investigation,
W77-02931 5B

FLORIDA
Sebastian Inlet. Glossary of Inlets Report No. 3,
W77-02673 2L

Biscayne Bay and its Environs. An Analysis of Its Present and Future Uses for Metropolitan Dade County,
W77-02680 5G

The Effect of Temperature-Salinity Combinations on The Functional Well-Being of Adult Lytechinus Variegatus (Lamarck) (Echinodermata, Echinoidea),
W77-03054 5C

FLOTATION
Leather Industry Effluent Purification - By Acidification Prior to Lime Treatment and Separation by Flotation.
W77-02614 5D

FLOUNDER
Winter Flounder Movements, Growth, and Mortality Off Massachusetts,
W77-03052 5C

FLOUNDERS
Viable Embryogenesis of the Winter Flounder Pseudopleuronectes Americanus from -1.8 deg to 15 deg C,
W77-03029 5C

FLOW
Effects of Flood Flows on Water Quality of Tioga-Hammond Lakes; Hydraulic Model Investigation,
W77-02931 5B

FLOW CONTROL
Discharge Computations at River Control Structures,
W77-02986 4A

FLOW RATES
Discharge Computations at River Control Structures,
W77-02986 4A

FLOW RESISTANCE
Resistance Equation for Alluvial-Channel Flow,
W77-02971 8B

FLUCTUATING SHORELINES
The Effect of River Fluctuations Resulting from Hydroelectric Peaking on Selected Aquatic Invertebrates and Fish,
W77-03000 5G

FLUCTUATIONS
Nycthemeral Variation of the Phytoplankton in Campeche Bay, Mexico, (In Spanish),
W77-02854 5C

FLUIDIZED BED COMBUSION
An Environmental Overview of United States Energy Futures,
W77-02650 5G

FLUMES
Flume Studies with Fine and Coarse Sands,
W77-02976 2J

FLUORAPATITE
Supersaturation Phenomena and the Formation of Fluorapatite in Aqueous Suspensions of Phosphate Rock,
W77-03074 2G

FLUORINE
Fluorine in Drinking Water of Eastern Slovakia, (In Russian),
W77-03056 5A

FLY ASH
Performance of Lignite and Subbituminous Fly Ash in Concrete - A Progress Report,
W77-02803 8F

The Potential Trace Metal Contamination of Water Resources through the Disposal of Fly Ash,
W77-02873 5B

FOOD CHAINS
Distributions and Natural Levels of Related Metals in a Trophic Pathway,
W77-02646 5B

Observations of the Kelvin-Helmholtz Instability in Laboratory Models and Field Examples of Thermal Plumes,
W77-02796 2H

Reconstruction of Some of the Early Storm Surges on the Great Lakes,
W77-02797 2H

Lake Erie International Jetport Model Feasibility Investigation; Application of Three-Dimensional Hydrodynamic Model to Study Effects of Proposed Jetport Island on Thermocline Structure in Lake Erie,
W77-02994 2H

The Distribution and Abundance of Larval Fishes Along the Western Shore of Lake Erie at Monroe, Michigan,
W77-03011 2H

A Lakewide Study of Phytoplankton Biomass and its Species Composition in Lake Erie, April-December 1970,
W77-03039 5C

LAKE GEORGE (NY)
Ecological Modeling and Estimation of Stress,
W77-02622 5C

LAKE HURON
Asbestiform Fibre Levels in Lakes Superior and Huron,
W77-02753 5B

LAKE ICE
Great Lakes Ice Cover, Winter 1974-75,
W77-02677 2C

LAKE MAUREPAS (LA)
An Inventory and Study of the Lake Pontchartrain-Lake Maurepas Estuarine Complex.
W77-02671 2L

An Inventory and Study of the Lake Pontchartrain-Lake Maurepas Estuarine Complex,
W77-02879 5C

LAKE MEAD (NEVADA)
Corrosion of Selected Materials in Lake Mead Water,
W77-02832 8G

LAKE MICHIGAN
A Statement of Concerns and Suggested Ecological Research, Report Number 1 of the Lake Michigan Cooling Water Studies Panel.
W77-02636 5C

Scanning Thermal Plumes,
W77-02682 5A

Lethal and Preferred Temperatures of the Alewife (Alosa Pseudoharengus) in Lake Michigan,
W77-02710 5C

Macrozoobenthic Species Assemblages of Southeastern Lake Michigan, U.S.A.,
W77-02728 2H

LAKE ONTARIO
Circulation, Diffusion and Frontal Dynamics in the Coastal Zone,
W77-02794 2H

Nitrogen in Sedimented Organic Matter from Lake Ontario,
W77-02815 5C

LAKE PONTCHARTRAIN
An Inventory and Study of the Lake Pontchartrain-Lake Maurepas Estuarine Complex,
W77-02879 5C

LAKE PONTCHARTRAIN (LA)
An Inventory and Study of the Lake Pontchartrain-Lake Maurepas Estuarine Complex.
W77-02671 2L

Hydraulic Characteristics of Rigolets Pass, Louisiana, Hurricane Surge Control Structures; Hydraulic Model Investigation,
W77-02932 8B

LAKE SANGCHRIS (ILL)
The Ecology of an Artificial Cooling Lake,
W77-02723 5C

LAKE SEDIMENTS
Nitrogen in Sedimented Organic Matter from Lake Ontario,
W77-02815 5C

LAKE SEVAN
Successions of the Vegetation Cover on the Drying Bottom of Lake Sevan, (In Russian),
W77-02736 2H

LAKE ST. CLAIR (MICH)
Lake St. Clair Beginning-of-Month Water Levels and Monthly Rates of Change of Storage,
W77-02675 2H

LAKE SUPERIOR
Asbestiform Fibre Levels in Lakes Superior and Huron,
W77-02753 5B

Procedure for Examination of Water and Sediment Samples for Total Asbestos Fibre Count by Electron Microscopy,
W77-02766 5A

LAKE TROUT
The Pathology of Pesticide Poisoning,
W77-02694 5C

LAKE WABAMUN (ALBERTA)
The Effect of the Discharge of Thermal Effluent from a Power Station on the Primary Productivity of an Epiphytic Algal Community,
W77-03046 5C

LAKE WHITEFISH
Temperature Tolerance of Young-of-the-Year Lake Whitefish, Coregonus Clupeaformis,
W77-03024 5C

LAKES
The Effect of Agriculture on the Surroundings of Lake Balaton,
W77-02776 5B

Observations of the Kelvin-Helmholtz Instability in Laboratory Models and Field Examples of Thermal Plumes,
W77-02796 2H

Evaluation of the Phytoplankton Biomass in Lakes of the World, (In Russian),
W77-02816 2H

Surface Water Supply of the United States, 1966-70: Part 1. North Atlantic Slope Basins--Volume 2. Basins from New York to Delaware.
W77-02980 7C

Surface Water Supply of the United States, 1966-70: Part 11. Pacific Slope Basins in California--Volume 3. Southern Central Valley Basins.
W77-02981 7C

LAND DEVELOPMENT
Effect of Land Development on Soil Erosion and Sediment Concentration in an Urbanizing Basin,
W77-02793 4C

LAND DISPOSAL
Land Disposal of Sewage Sludge, Volume III, April 1974 - March, 1975,
W77-02756 5D

LAND MANAGEMENT
Effects of Soil Conservation Treatment on Runoff and Sediment Loss from a Catchment in Southwestern New South Wales, Australia,
W77-02772 4D

Soil Cover Governs Soil Loss on United States Claypan Soils,
W77-02787 4D

LAND RECLAMATION
Impacts of Construction Activities in Wetlands of the United States,
W77-03007 5C

LAND USE
Geographic Areas of Particular Concern.
W77-02687 2L

Maryland Uplands Natural Areas Study. Vol I: Eastern Shore,
W77-02690 2L

Maryland Uplands Natural Areas Study. Vol II: Eastern Shore Field Notebook,
W77-02691 2L

Prediction of Erosion Intensification by Man,
W77-02784 4C

Soil Cover Governs Soil Loss on United States Claypan Soils,
W77-02787 4D

Mapping and Measuring Land-Cover Characteristics of New River Basin, Tennessee, Using Landsat Digital Tapes,
W77-02978 4A

Analysis of Nonpoint-Source Pollutants in the Missouri Basin Region,
W77-03013 5B

LANDSAT DIGITAL TAPES
Mapping and Measuring Land-Cover Chara
teristics of New River Basin, Tennessee, Usi
Landsat Digital Tapes,
W77-02978

LARVAE
Effects of Water Quality on Larval Settlemen
in Los Angeles Harbor as Determined by Mu
tivariate Statistical Techniques,
W77-02735

Sublethal Effect of 5-Chlorouracil on Cu
(Cyprinus Carpio) Larvae,
W77-03031

LARVAL GROWTH STAGE
Effect of Shear on Eggs and Larvae of Strip
Bass, Morone Saxatilis, and White Perch,
Americana,
W77-02714

Sublethal Effect of 5-Chlorouracil on Cu
(Cyprinus Carpio) Larvae,
W77-03031

LEACHING
Minimal Leaching with Varying Root Depths
Alfalfa,
W77-03066

Fertilizer or Salt Leaching as Affected by S
face Shaping and Placement of Fertilizer
Irrigation Water,
W77-03072

LEAD
Comparative Methylation Chemistry
Platinum, Palladium, Lead, and Manganese,
W77-02623

Environmental Pollution in the New Lead B
(Rann Utilization Experience, Case Study
2),
W77-02639

Compilation of State Data for Eight Selec
Toxic Substances, Vol. V, Monitoring Prog
Capability, Descriptor Tables,

W77-03030 7B

A Lakewide Study of Phytoplankton Biomass and its Species Composition in Lake Erie, April-December 1970,
W77-03039 5C

SAMPLING METHODOLOGIES
Sampling and Analysis of Stormwater Runoff from Urban and Semi-Urban/Rural Watersheds - Systematic Development of Methodologies in Planning Urban Water Resources for Medium Size Communities,
W77-02995 5B

SAND AQUIFERS
Water Under the Sand,
W77-02852 4B

SANDS
Influence of Sand in Redds on Survival and Emergence of Brook Trout (Salvelinus Fontinalis),
W77-02711 2I

Effect of Groundwater Moisture on the Formation of the Sandy Soils of the Ket-Tym Region of the Ob River, (In Russian),
W77-02885 2G

Study and Evaluation of Remedial Sand Bypassing Procedures,
W77-02933 2L

Model Materials Evaluation Sand Tests; Hydraulic Laboratory Investigation,
W77-02938 8G

Flume Studies with Fine and Coarse Sands,
W77-02976 2J

SANDSTONES
Water Under the Sand,
W77-02852 4B

SANDY SOILS
Effect of Method of Nitrogen Application on Corn (Zea Mays L.) Grown on Irrigated Sandy Soil,
W77-03071 3F

SANTA BARBARA
Temperature Effects of Crude Oil in the Upper Intertidal Zone,
W77-03004 5C

SANTA BARBARA CRUDE OIL
Temperature Effects of Crude Oil in the Upper Intertidal Zone,
W77-03004 5C

SAPROBITY INDEX
The General Character of the Water of the Middle of the Saale River, (In German),
W77-02910 5B

SATELLITE IMAGERY
An Analysis of Great Lakes Ice Cover from Satellite Imagery,
W77-02676 2C

SATELLITES (ARTIFICIAL)
Trophic Classification of Lakes Using LANDSAT-1 (ERTS-1) Multispectral Scanner Data,
W77-02825 5A

Mapping and Measuring Land-Cover Characteristics of New River Basin, Tennessee, Using Landsat Digital Tapes,
W77-02978 4A

SATURATED SOILS
Waterlogging in an Alluvial Aquifer Near Lake Minnequa, Pueblo, Colorado,
W77-02983 2F

SCREENS
Pilot Scale Evaluation of a Physical-Chemical Wastewater Treatment System for Combined Sewer Overflows.
W77-02757 5D

SCULPINS
Bioaccumulation of Mercury in Myoxocephalus Quadricornis (L.) (Teleostei, Cottidae) in an Unpolluted Area of the Baltic,
W77-02731 5C

Upper Lethal and Preferred Temperatures of the Slimy Sculpin, Cottus Cognatus,
W77-03025 5C

SEA HARE
Polyhalogenated Monoterpenes from the Red Alga, Plocamium Cartilagineum,
W77-02734 5C

SEA LEVEL
Delaware's Changing Shoreline,
W77-02684 2L

SEA OF AZOV
Distinctive Features of Self-Purification of Water and Sediments of a Shallow Sea as Exemplified by the Sea of Azov, (In Russian),
W77-02897 5G

SEA URCHINS
The Effect of Temperature-Salinity Combinations on The Functional Well-Being of Adult Lytechinus Variegatus (Lamarck (Echinodermata, Echinoidea),
W77-03054 5C

SEA WATER
The Effect of Dissolved Organic Matter in Sea Water on the Uptake of Mixed Individua Hydrocarbons and Number 2 Fuel Oil by Marine Filter-Feeding Bivalve (Mercenari Mercenaria),
W77-02817 5C

SEASONAL
Seasonal Variations in Concentrations o Nitrate and Total Phosphorus, and Calculate Nutrient Loading for Six Lakes in Weste New York,
W77-02588 5C

Lethal and Preferred Temperatures of th Alewife (Alosa Pseudoharengus) in Lak Michigan,
W77-02710 5C

Macrozoobenthic Species Assemblages o Southeastern Lake Michigan, U.S.A.,
W77-02728 2I

SEDIMENT DISCHARGE
The Erosion Index as a Factor for Determinin Turbidity in Rivers (L'Indice D'Erosion-Fac teur de Determination de la Turbidite de Rivieres),
W77-02773 2

Plant Cover and Sediment Transportation in th River Basin of the Seine (La Couvertur Vegetale et Les Debits Solides Des Cour D'Eau Dans Le Bassin De La Seine),
W77-02775 2

SEDIMENT TRANSPORT
Participation of ERDA in the Transport an Ecological Effects Categories of the Pas Through Program,
W77-02654 5C

Sebastian Inlet. Glossary of Inlets Report N 3,
W77-02673 2

Sediment Dispersal Patterns as Clues to Place like Platinum Accumulation in and Near Cha van Bay, Alaska,
W77-02681 5

Delaware's Changing Shoreline,
W77-02684 2

Finite-State Models of Transport Phenomena Hydrologic Systems,
W77-02865 2

Study and Evaluation of Remedial San Bypassing Procedures,
W77-02933 2

Model Materials Evaluation Sand Test Hydraulic Laboratory Investigation,
W77-02938 8

Feasibility of Monitoring Flow Patterns an Sediment and Pollutant Dispersion of Wat Bodies with 24-Channel Spectral Data,
W77-02946 5

Resistance Equation for Alluvial-Chann Flow,
W77-02971 8

Flume Studies with Fine and Coarse Sands,
W77-02976

DIMENT-WATER INTERFACES
DDE and Lindane in a Large-Scale Model Lentic Ecosystem,
W77-02713 5C

DIMENT YIELD
Effects of Man on the Interface of the Hydrological Cycle with the Physical Environment.
W77-02771 4D

Erosion Phenomena in Drainage Basins Reflected by Sediment Flow in Rivers Phenomenes D'Erosion des Bassins Versants Refletes par les Transports Solides des Cours D'Eau),
W77-02780 2J

The Effect of Afforestation on Erosion Processes and Sediment Yield,
W77-02781 4C

Predicting Sediment Yield Frequency for Rural Basins to Determine Man's Effect on Long-Term Sedimentation,
W77-02786 4D

Increase of Sediment Transport Due to Large-Scale Urbanization,
W77-02790 4C

Suspended Sediment Production and Building Activity in a Small British Basin,
W77-02792 4C

Effect of Land Development on Soil Erosion and Sediment Concentration in an Urbanizing Basin,
W77-02793 4C

Impact of Urbanization on Water Yield, Flood Peak Sediment Yield, and Water Quality in the Berkeley Hills, California,
W77-02999 4C

DIMENTATION
Sebastian Inlet. Glossary of Inlets Report No. 5,
W77-02673 2L

Urbanization and the Processes of Erosion and Sedimentation in the River Nile,
W77-02789 4C

Use of Automated Remote Sensing Techniques to Define the Movement of Tow-Generated Suspended Material Plumes on the Illinois and Upper Mississippi Rivers,
W77-02957 2J

DIMENTS
Sediment Dispersal Patterns as Clues to Placer-like Platinum Accumulation in and Near Chagvan Bay, Alaska,
W77-02681 5B

DDE and Lindane in a Large-Scale Model Lentic Ecosystem,
W77-02713 5C

Comparison of 115m Cd Accumulation from Sediments and Sea Waters by Polychaete Worms,
W77-02717 5B

Macrozoobenthic Species Assemblages of Southeastern Lake Michigan, U.S.A.,
W77-02728 2H

Procedure for Examination of Water and Sediment Samples for Total Asbestos Fibre Count by Electron Microscopy,
W77-02766 5A

A Method for the Determination of Mercury in Sediments by the Automated Cold Vapor Atomic Absorption Technique after Digestion,
W77-02811 5A

SEINE RIVER
Plant Cover and Sediment Transportation in the River Basin of the Seine (La Couverture Vegetale et Les Debits Solides Des Cours D'Eau Dans Le Bassin De La Seine),
W77-02775 2J

SEISMIC DESIGN
Optimization of Water Resource Systems Incorporating Earthquake Risk,
W77-02831 6A

SELENIUM
Levels of Arsenic and Selenium in the Great Lakes Region,
W77-02751 5A

SELF PURIFICATION
Distinctive Features of Self-Purification of Water and Sediments of a Shallow Sea as Exemplified by the Sea of Azov, (In Russian),
W77-02897 5G

SEPARATION
Treating Effluent Containing Compounds Pref. Dyes - By Adding Salt Generator of Opposite Charge to Effluent Ion then Ultra-Filtering.
W77-02612 5D

SEPARATION TECHNIQUES
Leather Industry Effluent Purification - By Acidification Prior to Lime Treatment and Separation by Flotation.
W77-02614 5D

Thin-Layer Chromatographic Determination of Anthio and Butyphos in Water, (In Russian),
W77-03022 5A

SEPTIC TANKS
Improving Design Criteria for Septic Tank Systems,
W77-02621 5D

SEWAGE
Practices, Policies and Technology of Storm and Combined Sewers in Foreign Countries.
W77-02767 5G

Experience in Centralized Collection, Processing and Analysis of Sanitary-Hygienic Information, (In Russian),
W77-02908 5A

The Biology and Chemistry of a Warm-Water Stream,
W77-03010 5C

SEWAGE BACTERIA
Detection of Pathogenic Leptospires in Effluent and Sewage Sludge from Large Piggeries, (In German),
W77-02998 5A

SEWAGE DISPOSAL
Land Disposal of Sewage Sludge, Volume III, April 1974 - March, 1975,
W77-02756 5D

Measures to Counteract Daily Water Pollution: Development Tendencies in USA, (In Swedish),
W77-03035 5D

SEWAGE EFFLUENTS
Detection of Pathogenic Leptospires in Effluent and Sewage Sludge from Large Piggeries, (In German),
W77-02998 5A

Recovery of Polluted Lakes; A Swedish Research Program on the Effects of Advanced Wastewater Treatment and Sewage Diversion: 7. Diffuse Municipal Pollution: Examples from the Towns of Motala and Uppsala, (In Swedish),

SEWAGE TREATMENT
Land Disposal of Sewage Sludge, Volume III, April 1974 - March, 1975,
W77-02756 5D

Measures to Counteract Daily Water Pollution: Development Tendencies in USA, (In Swedish),
W77-03035 5D

Recovery of Polluted Lakes; A Swedish Research Program on the Effects of Advanced Wastewater Treatment and Sewage Diversion: 7. Diffuse Municipal Pollution: Examples from the Towns of Motala and Uppsala, (In Swedish),
W77-03057 5D

SEWERAGE
Measures to Counteract Daily Water Pollution: Development Tendencies in USA, (In Swedish),
W77-03035 5D

SEWERS
Effect of Storage on Storm and Combined Sewers,
W77-02746 5D

Pilot Scale Evaluation of a Physical-Chemical Wastewater Treatment System for Combined Sewer Overflows.
W77-02757 5D

Practices, Policies and Technology of Storm and Combined Sewers in Foreign Countries.
W77-02767 5G

SHAD
Observations on Gas Bubble Disease Among Wild Adult Columbia River Fishes,
W77-02705 5C

SHEAR STRESS
Effect of Shear on Eggs and Larvae of Striped Bass, Morone Saxatilis, and White Perch, M. Americana,
W77-02714 5C

SHEARED COORDINATE SYSTEM
A Sheared Coordinate System for Storm Surge Equations of Motion with a Mildly Curved Coast,
W77-02674 2B

SHIP MOTION DATA
Los Angeles and Long Beach Harbors Model Study; Report 3, Analyses of Wave and Ship Motion Data,
W77-02955 8B

SHIPBOARD ENVIRONMENTAL DATA ACQUISITION
NOAA's Activities In Energy Related Measurement and Monitoring,
W77-02652 5G

SHOALING
Improvements for Masonboro Inlet, North Carolina; Hydraulic Model Investigation,
W77-02958 8B

SHOALS
Design for Wave Protection, Flood Control, and Prevention of Shoaling, Cattaraugus Creek Harbor, New York; Hydraulic Model Investigation,
W77-02952 8B

SHORE PROTECTION
Delaware's Changing Shoreline,
W77-02684 2L

SHORELINE CHANGES
Delaware's Changing Shoreline,
W77-02684 2L

SHORES
Beach Nourishment Techniques; Report 1, Dredging Systems for Beach Nourishment from Offshore Sources,
W77-02965 2J

SHRUBS
Comparative Morphological and Ecophysiological Aspects of Two Sclerophyllous Chilean Shrubs,
W77-02858 3B

SILICA
Silica in Water in Relation to Cooling Tower Operation,
W77-02875 5D

SILICONES
Laboratory Evaluation of Wax and Silicone for Water Harvesting on Coal Mine Spoil,
W77-02589 3B

SILTS
Biologically Active Substances of the Silt Deposits of Dnieper Reservoirs, (In Russian),
W77-02934 5B

SIMULATION ANALYSIS
Hydrodynamics-Dispersion Studies in Storm Sewers,
W77-02827 8B

SIMULTANEOUS EQUATION ECONOMETRIC MODEL
An Empirical Analysis of Predictors of Income Distribution Effects of Water Quality Controls,
W77-02833 5G

SLOPE PROTECTION
A Note on Efficacy of Vegetative Covers and Slopes on Runoff and Fertility Losses in a Semi-Arid Tract of Rajasthan,
W77-02856 4D

SLOPE STABILIZATION
A Note on Efficacy of Vegetative Covers and Slopes on Runoff and Fertility Losses in a Semi-Arid Tract of Rajasthan,
W77-02856 4D

SLOPES
A Note on Efficacy of Vegetative Covers and Slopes on Runoff and Fertility Losses in a Semi-Arid Tract of Rajasthan,
W77-02856 4D

Effects of Tree Growth Near Small Waterways of Muenster on Vegetation in Water and on Slopes with Respect to Maintenance of those Waterways, (In German),
W77-02887 4A

SLUDGE
Anaerobic Digestion of Lime Sewage Sludge,
W77-02750 5D

Detection of Pathogenic Leptospires in Effluent and Sewage Sludge from Large Piggeries, (In German),
W77-02998 5A

SLUDGE DISPOSAL
Handling Discharges from Waste Oil Processing,
W77-02604 5D

Computer-Aided Planning of Regional Sludge Disposal Systems, User's Manual,
W77-02745 5D

SLUDGE INCINERATOR ASH
Removal and Recovery of Metals from Sludge and Sludge Incinerator Ash,
W77-02763 5D

SLUDGE TREATMENT
Removal and Recovery of Metals from Sludge and Sludge Incinerator Ash,
W77-02763 5D

SMALL WATERSHEDS
Suspended Sediment Production and Building Activity in a Small British Basin,
W77-02792 4C

SMITH MOUNTAIN-LEESVILLE PROJECT (VA)
The Smith Mountain - Leesville Project: A Case History,
W77-02715 5C

SMOLT
Investigation of the Salmon (Salmo Salar) Smolt Migration of the Big Salmon River, New Brunswick, 1966-72,
W77-03059 5C

SNOWMELT
Winter Runoff from an Urban Catchment, (January to March 1974),
W77-02739 4C

SOCIAL ASPECTS
Public Interest Methods for Assessing Chemical Hazards,
W77-02846 5C

SOCIAL IMPACT
Participation of ERDA in the Transport and Ecological Effects Categories of the Pass-Through Program,
W77-02654 5G

SOCKEYE SALMON
Observations on Gas Bubble Disease Among Wild Adult Columbia River Fishes,
W77-02705 5C

SODIUM CHLORIDE
Standard Test Fish Development. Part I. Fat-Head Minnows (Pimephales Promelas) and Goldfish (Carassius Auratus) as Standard Fish in Bioassays and their Reaction to Potential Reference Toxicants,
W77-03002 5A

SOIL AERATION
The Aeration Conditions of Southern and Ciscaucasian Chernozems Under Irrigation, (In Russian),
W77-02927 2G

Combined Effects of Low Oxygen and Salinity on Germination of a Semi-Dwarf Mexican Wheat,
W77-03068 3C

SOIL ANALYSIS
Landscape Geochemistry and Environmental Problems,
W77-02849 5A

SOIL AUGERS
A Hydraulically Driven Soil Auger for Sampling Fine-Textured and Wet Soils,
W77-03063 2G

SOIL CHEMICAL PROPERTIES
Effect of Irrigation on Some Properties of Southern Chernozems, (In Russian),
W77-02889 2G

Physical and Chemical Properties of Takyr Soils and Changes in Their Agrochemical Properties After Irrigation, (In Russian),
W77-02929 3F

SOIL CHEMISTRY
Landscape Geochemistry and Environmental Problems,
W77-02849 5A

SOIL CLASSIFICATION
Extensive Overburden Potentials for Soil and Water Quality,
W77-03008 5E

SOIL COLUMNS
A Device for Isolating Field Soil Columns with Minimum Disturbance,
W77-03065 2G

SOIL CONSERVATION
Effects of Soil Conservation Treatment on Runoff and Sediment Loss from a Catchment in Southwestern New South Wales, Australia,
W77-02772 4D

SOIL CONSISTENCY
Studies on Soil Consistency: I. Comprehensive Investigations of the Consistency. (In Japanese),
W77-02888 2G

SOIL CORES
A Compaction Apparatus for the Preparation of Soil Cores of Different Bulk Densities and Thicknesses,
W77-03067 2G

SOIL EROSION
Effects of Man on the Interface of the Hydrological Cycle with the Physical Environment.
W77-02771 4A

Prediction of Erosion Intensification by Man,
W77-02784 4A

Soil Cover Governs Soil Loss on United States Claypan Soils,
W77-02787 4A

Suspended Sediments from Urban Development,
W77-02788 4A

A Note on Efficacy of Vegetative Covers and Slopes on Runoff and Fertility Losses in a Semi-Arid Tract of Rajasthan,
W77-02856 4D

SOIL GROUPS
Effect of Irrigation on Some Properties of Southern Chernozems, (In Russian),
W77-02889 2G

The Aeration Conditions of Southern and Ciscaucasian Chernozems Under Irrigation, (In Russian),
W77-02927 2G

SOIL INVESTIGATIONS
A Device for Isolating Field Soil Columns with Minimum Disturbance,
W77-03065 2G

A Technique for Installing Induction Coils in a Profile with Minimum Soil Disturbance,
W77-03069 2G

Effect of Temperature on Denitrification Rate in Soils,
W77-03070 2G

SOIL MECHANICS
A Technique for Installing Induction Coils in a Profile with Minimum Soil Disturbance,
W77-03069 2G

SOIL MOISTURE
Structural Composition and Some Problems of the Water Regime of Dark-Chestnut Soils of the Kustanai Oblast in Connection with the Duration of their Cultivation, (In Russian),
W77-02853 2G

Comparative Morphological and Ecophysiological Aspects of Two Sclerophyllous Chilean Shrubs,
W77-02858 3B

Consumption Use and Water Requirement of Dwarf Wheat in Light Texture Soils of Rajasthan,
W77-02860 3F

Effect of Groundwater Moisture on the Formation of the Sandy Soils of the Ket-Tym Region of the Ob River, (In Russian),
W77-02885 2G

A Comparative Study of the Effect of Soil Moisture on the Growth and Transpiration of Certain Poplar Forms, (In Bulgarian),
W77-02886 2I

Studies on Soil Consistency: I. Comprehensive Investigations of the Consistency, (In Japanese),
W77-02888 2G

SOIL PHYSICAL PROPERTIES
Structural Composition and Some Problems of the Water Regime of Dark-Chestnut Soils of the Kustanai Oblast in Connection with the Duration of their Cultivation, (In Russian),
W77-02853 2G

Studies on Soil Consistency: I. Comprehensive Investigations of the Consistency, (In Japanese),
W77-02888 2G

The Effect of Stand Structure on Water Regime of Mountain Soils of the Carpathians, (In Russian),
W77-02923 4A

Physical and Chemical Properties of Takyr Soils and Changes in Their Agrochemical Properties After Irrigation, (In Russian),
W77-02929 3F

Changes in the Physical Properties of Soil Clays Due to Precipitated Aluminum and Iron Hydroxides: I. Swelling and Aggregate Stability After Drying,
W77-03073 2G

SOIL PROPERTIES
Studies on Soil Consistency: I. Comprehensive Investigations of the Consistency, (In Japanese),
W77-02888 2G

SOIL SAMPLING
A Hydraulically Driven Soil Auger for Sampling Fine-Textured and Wet Soils,
W77-03063 2G

SOIL STRUCTURE
Structural Composition and Some Problems of the Water Regime of Dark-Chestnut Soils of the Kustanai Oblast in Connection with the Duration of their Cultivation, (In Russian),
W77-02853 2G

SOIL TESTS
Studies on Soil Consistency: I. Comprehensive Investigations of the Consistency, (In Japanese),
W77-02888 2G

A Hydraulically Driven Soil Auger for Sampling Fine-Textured and Wet Soils,
W77-03063 2G

A Device for Isolating Field Soil Columns with Minimum Disturbance,
W77-03065 2G

A Compaction Apparatus for the Preparation of Soil Cores of Different Bulk Densities and Thicknesses,
W77-03067 2G

A Technique for Installing Induction Coils in a Profile with Minimum Soil Disturbance,
W77-03069 2G

SOIL WATER
The Effect of Stand Structure on Water Regime of Mountain Soils of the Carpathians, (In Russian),
W77-02923 4A

Soil Water Extraction by Alfalfa,
W77-03064 3C

SOIL-WATER-PLANT RELATIONSHIPS
The Productiveness of Loess Soils of Different Degrees of Erosion, (In German),
W77-02891 3F

Impacts of Construction Activities in Wetlands of the United States,
W77-03007 5C

SOILS
Studies on Soil Consistency: I. Comprehensive Investigations of the Consistency, (In Japanese),
W77-02888 2G

Determination of the Critical Depth for Bagaevsko-Sadki Irrigation System, (In Russian),
W77-02928 3F

Annual Dynamics of Soluble Salts in the Soils of an Irrigated Field with Both Deep Closed and Open Drainage at the Bagaevsko-Sadkovskaya Irrigation System, (In Russian),
W77-02930 3F

SOLAR DISTILLATION
Solar Distillation in Chile,
W77-02862 3A

SOLAR STILLS
Solar Distillation in Chile,
W77-02862 3A

SOLID WASTES
Wastewater Requirements Multiply Solids Problems,
W77-02601 5G

SOLUTES
Content of Lithium, Uranium and Thorium in Mineral Springs of the Nakhichevan ASSR, (In Russian),
W77-03016 5A

SORBENTS
Selection Criteria and Laboratory Evaluation of Oil Spill Sorbents.
W77-02769 5G

SOUTH CAROLINA
Cooper River Rediversion Project, Bushy Park Water Supply Tests; Hydraulic Model Investigation,
W77-02939 8B

Effects of 40-Foot Charleston Harbor Project on Tides, Currents and Salinities; Hydraulic Model Investigation,
W77-02947 8B

SOUTH DAKOTA
Major Aquifers in Hand and Hyde Counties, South Dakota,
W77-02992 4B

SOUTHERN INDIAN LAKE (MANITOBA)
Lake Whitefish (Corregonus Clupeaformis (Mitchill) in Southern Indian Lake, Manitoba,
W77-02821 2H

SOVIET UNION (USSR)
Possibility of Introducing Waste-Free Technology in the Pulp and Paper Industry (Vozmozhnosti vnedreniya bezotkhodnoi tekhnologii v otrasli),
W77-02583 3E

SPATIAL DISTRIBUTION
Spatial and Temporal Variations in the Interstitial Water Chemistry of Chesapeake Bay Sediments,
W77-02808 5C

A Lakewide Study of Phytoplankton Biomass and its Species Composition in Lake Erie, April-December 1970,
W77-03039 5C

SPAWNING
Influence of Sand in Redds on Survival and Emergence of Brook Trout (Salvelinus Fontinalis),
W77-02711 2I

SPECIATION
Successions of the Vegetation Cover on the Drying Bottom of Lake Sevan, (In Russian),
W77-02736 2H

SPECIES COMPOSITION
A Lakewide Study of Phytoplankton Biomass and its Species Composition in Lake Erie, April-December 1970,
W77-03039 5C

SPECIES DIVERSITY
Changes in Fish Species Composition in the Au Sable River, Michigan from the 1920's to 1972,
W77-02712 5C

SPECTROSCOPY
Identification of Acid-Containing Fraction of Odorants of Natural Water, (In Russian),
W77-02901 5A

SPILLWAYS
Chute Spillway for Cowanesque Dam Cowanesque River, Pennsylvania; Hydraulic Model Investigation,
W77-02959 8B

SPOIL BANKS
Laboratory Evaluation of Wax and Silicone for Water Harvesting on Coal Mine Spoil,
W77-02589 3B

SPRAYING
Aerial Spraying of Phreatophytes with Antitranspirant,
W77-02867 3B

SPRINGS
Content of Lithium, Uranium and Thorium in Mineral Springs of the Nakhichevan ASSR, (In Russian),
W77-03016 5A

SPRINKLER IRRIGATION
Adaptation to Increasing Salinity of the Colorado River,
W77-02997 3C

ST. LAWRENCE RIVER
Controlled Combustion Tests Carried Out Near Rimouski,
W77-02759 5E

ST. LAWRENCE SEAWAY
Ice Flushing from St. Lawrence Seaway Locks; Hydraulic Model Investigation,
W77-02953 8B

STATE AGENCIES
Compilation of State Data for Eight Selected Toxic Substances. Volume II, Directory of State Toxic Substances Monitoring Agencies,
W77-02642 5G

STATE AGENCY CONTACTS
Compilation of State Data for Eight Selected Toxic Substances. Volume II, Directory of State Toxic Substances Monitoring Agencies,
W77-02642 5G

STATE GOVERNMENTS
Proceedings of Seminar Sessions on State Water Supply Planning, Sept. - Oct. 1975, (Executive Summary).
W77-02618 6B

Proceedings of Seminar Sessions on State Water Supply Planning (Sept.-Oct. 1975).
W77-02619 6B

Compilation of State Data for Eight Selected Toxic Substances. Volume II, Directory of State Toxic Substances Monitoring Agencies,
W77-02642 5G

STATISTICAL ANALYSIS OF SIGNIFICANCE
Analysis of Nonpoint-Source Pollutants in the Missouri Basin Region,
W77-03013 5B

STATISTICAL METHODS
Effects of Water Quality on Larval Settlements in Los Angeles Harbor as Determined by Multivariate Statistical Techniques,
W77-02735 5C

Analysis of Nonpoint-Source Pollutants in the Missouri Basin Region,
W77-03013 5B

STATISTICS
Determination of Estimated Mean Mine Water Quantity and Quality from Imperfect Data and Historical Records.
W77-03014 5B

STEADY FLOW
Hydraulic Characteristics of Rigolets Pass, Louisiana, Hurricane Surge Control Structures; Hydraulic Model Investigation,
W77-02932 8B

STEEL
Pollution Control in Indian Steel Industry,
W77-02605 5B

STEEL INDUSTRY (INDIA)
Pollution Control in Indian Steel Industry,
W77-02605 5B

STEELHEAD
Observations on Gas Bubble Disease Among Wild Adult Columbia River Fishes,
W77-02705 5C

STILLING BASINS
Tioga Outlet Works, Tioga and Hammond Lakes, Susquehanna River Basin, Pennsylvania; Hydraulic Model Investigation,
W77-02956 8B

STORAGE
Effect of Storage on Storm and Combined Sewers,
W77-02746 5D

STORM DRAINS
Hydrodynamics-Dispersion Studies in Storm Sewers,
W77-02827 8B

STORM RUNOFF
Sampling and Analysis of Stormwater Runoff from Urban and Semi-Urban/Rural Watersheds - Systematic Development of Methodologies in Planning Urban Water Resources for Medium Size Communities,
W77-02995 5B

STORM SURGE
A Sheared Coordinate System for Storm Surge Equations of Motion with a Mildly Curved Coast,
W77-02674 2B

STORM TRACKS
A Sheared Coordinate System for Storm Surge Equations of Motion with a Mildly Curved Coast,
W77-02674 2B

STORM WATER
Storm Tide Frequency Analysis for the Open Coast of Virginia, Maryland, and Delaware,
W77-02661 2L

Storm Water Management Model Study, Volume I.
W77-02743 5B

Storm Water Management Model Study, Volume II.
W77-02744 5B

Practices, Policies and Technology of Storm and Combined Sewers in Foreign Countries.
W77-02767 5G

STORM WATER MANAGEMENT MODEL (SWMM)
Storm Water Management Model Study Volume II.
W77-02744 5B

STORMS
A Sheared Coordinate System for Storm Surge Equations of Motion with a Mildly Curved Coast,
W77-02674 2B

STRAIT OF MAGELLAN
The Metula Oil Spill,
W77-02679 5C

STRATIFIED FLOW
B. Everett Jordan Lake Water-Quality Study,
W77-02954 5B

Stratified Flow in Great Salt Lake Culvert,
W77-02987 8B

STRATIGRAPHY
Stratigraphy and History of Development of the Voitovtsovsk Bog in the Vinnitsa Oblast (In Ukrainian),
W77-02922 2B

STREAM FISHERIES
Production by Brook Trout (Salvelinus Fontinalis) in Four Streams in the Matamek Watershed, Quebec,
W77-03020 5C

STREAM TURBIDITY
The Erosion Index as a Factor for Determining Turbidity in Rivers (L'Indice D'Erosion-Facteur de Determination de la Turbidite de Rivieres),
W77-02773 2

STREAMFLOW
Surface Water Supply of the United States 1966-70: Part 1. North Atlantic Slope Basins-Volume 2. Basins from New York to Delaware
W77-02980 7C

Surface Water Supply of the United States 1966-70: Part 11. Pacific Slope Basins in California--Volume 3. Southern Central Valley Basins.
W77-02981 7C

Discharge Computations at River Control Structures,
W77-02986 4A

Convective Model of Longitudinal Dispersion,
W77-02988 5B

STREAMFLOW COMPUTATIONS
Discharge Computations at River Control Structures,
W77-02986 4A

STREAMS
The Erosion Index as a Factor for Determining Turbidity in Rivers (L'Indice D'Erosion-Fa

teur de Determination de la Turbidite des Rivieres),
W77-02773 2J

Effects of Tree Growth Near Small Waterways of Muenster on Vegetation in Water and on Slopes with Respect to Maintenance of those Waterways, (In German),
W77-02887 4A

The Biology and Chemistry of a Warm-Water Stream,
W77-03010 5C

TRESS
Physiological Responses of Rainbow Trout (Salmo Gairdneri) to Electroshock,
W77-03026 5C

Increased Opercular Rates of Pink Salmon (Oncorhynchus Gorbuscha) Fry after Exposure to the Water-Soluble Fraction of Prudhoe Bay Crude Oil,
W77-03032 5C

TRIP MINE LAKES
Freshwater Ecological Effects,
W77-02657 5G

TRIP MINE WASTES
Monitoring Western Energy Resource Developments,
W77-02651 5G

Freshwater Ecological Effects,
W77-02657 5G

Extensive Overburden Potentials for Soil and Water Quality,
W77-03008 5B

TRIP MINES
Freshwater Ecological Effects,
W77-02657 5G

Extensive Overburden Potentials for Soil and Water Quality,
W77-03008 5B

TRIP MINING
The EPA Research Program on the Freshwater Ecological Effects of Energy Development and Use,
W77-02658 5G

TRIPED BASS
Effect of Shear on Eggs and Larvae of Striped Bass, Morone Saxatilis, and White Perch, M. Americana,
W77-02714 5C

UBLETHAL EFFECTS
Chlorine-Containing Stable Organics: New Compounds of Environmental Concern,
W77-02727 5C

Sublethal Effect of 5-Chlorouracil on Carp (Cyprinus Carpio) Larvae,
W77-03031 5C

Increased Opercular Rates of Pink Salmon (Oncorhynchus Gorbuscha) Fry after Exposure to the Water-Soluble Fraction of Prudhoe Bay Crude Oil,
W77-03032 5C

UBMERGENCE
Quantitative Relations Between the Bryophytes of the Belgian Part of the River Sambre and their Frequency of Emersion: Vertical Distribution and Influence of Pollution, (In French),
W77-03038 5B

SUBSIDENCE
Delaware's Changing Shoreline,
W77-02684 2L

SUBSURFACE IRRIGATION
Distribution of Water and Ions in Soils Irrigated and Fertilized from a Trickle Source,
W77-02855 3F

SUBSURFACE WATERS
Water Under the Sand,
W77-02852 4B

SUCKERS
Movement of Yellow Perch (Perca Flavescens) and White Sucker (Catostomus Commersoni) in a Nearshore Great Lakes Habitat Subject to a Thermal Discharge,
W77-03027 5C

SULFITE LIQUORS
Some Internal Measures for Reducing Effluent Load, for Example, in a Calcium Bisulfite Mill (Einige innerbetriebliche Massnahmen zur Verminderung der Vorfluterbelastung, dargestellt am Beispiel einer Calciumbisulfitfabrik),
W77-02576 5D

Some Internal Measures for the Reduction of the Effluent Load Shown by the Example of a Calcium-Bisulphite Pulpmill (Einigeinnerbetriebliche Massnahmen zur Verminderung der Verfluterbelastung, dargestellt am Beispiel einer Calciumbisulfitfabrik),
W77-02609 5D

SULFITE PULP MILLS
Some Internal Measures for Reducing Effluent Load, for Example, in a Calcium Bisulfite Mill (Einige innerbetriebliche Massnahmen zur Verminderung der Vorfluterbelastung, dargestellt am Beispiel einer Calciumbisulfitfabrik),
W77-02576 5D

SUNFISHES
Effects of Turbidity on Ventilation Rates and Oxygen Consumption of Green Sunfish, Lepomis Cyanellus,
W77-02697 5C

DDE and Lindane in a Large-Scale Model Lentic Ecosystem,
W77-02713 5C

SUPERSATURATION
Observations on Gas Bubble Disease Among Wild Adult Columbia River Fishes,
W77-02705 5C

Two Devices for Removing Supersaturating Gases in Aquarium Systems,
W77-02706 5G

Supersaturation Phenomena and the Formation of Fluorapatite in Aqueous Suspensions of Phosphate Rock,
W77-03074 2G

SUPPLEMENTAL IRRIGATION
An Appraisal of Ground Water for Irrigation in the Appleton Area, West-Central Minnesota,
W77-02982 4B

SURFACE COAL MINING
An Environmental Overview of United States Energy Futures,
W77-02650 5G

SURFACE-GROUNDWATER RELATIONSHIPS
Effect of Groundwater Moisture on the Formation of the Sandy Soils of the Ket-Tym Region of the Ob River, (In Russian),
W77-02885 2G

Waterlogging in an Alluvial Aquifer Near Lake Minnequa, Pueblo, Colorado,
W77-02983 2F

SURFACE IRRIGATION
Trickle-Drip Irrigation: Principles and Application to Water Management in Tropical Soils,
W77-02868 3F

Fertilizer or Salt Leaching as Affected by Surface Shaping and Placement of Fertilizer and Irrigation Water,
W77-03072 3F

SURFACE MINING
Freshwater Ecological Effects,
W77-02657 5G

SURFACE MINING RECLAMATION
Freshwater Ecological Effects,
W77-02657 5G

SURFACE WATERS
A Reconnaissance of the Effects of a Forest Fire on Water Quality in Kings Canyon National Park, California,
W77-02973 5B

A Water-Quality Assessment of the Burnham Creek Watershed, Polk County, Minnesota,
W77-02979 5B

Surface Water Supply of the United States, 1966-70: Part 1. North Atlantic Slope Basins--Volume 2. Basins from New York to Delaware.
W77-02980 7C

Surface Water Supply of the United States, 1966-70: Part 11. Pacific Slope Basins in California--Volume 3. Southern Central Valley Basins.
W77-02981 7C

SURGEON FISH TOXICITY
Toxicity of the Surgeon Fishes-II Properties of the Principal Water Soluble Toxin,
W77-02700 5C

SURGES
Reconstruction of Some of the Early Storm Surges on the Great Lakes,
W77-02797 2H

Effects of Hurricane Surge Barrier on Hydraulic Environment, Jamaica Bay New York; Hydraulic Model Investigation,
W77-02966 8B

SURVEYS
A Sequential Approach to the Counting of Plankton Organisms,
W77-02721 7B

Increase of Sediment Transport Due to Large-Scale Urbanization,
W77-02790 4C

A New Towed Underwater Camera System for Wide-Range Benthic Surveys,
W77-03030 7B

SUSPENDED LOAD
Qualitative Composition of Irrigation Water and Suspended Load of the Ordzhonikidze Irrigation System, (In Russian),
W77-02890 5B

Use of Automated Remote Sensing Techniques to Define the Movement of Tow-Generated Suspended Material Plumes on the Illinois and Upper Mississippi Rivers,
W77-02957 2J

SUSPENDED SOLIDS
Effects of Turbidity on Ventilation Rates and Oxygen Consumption of Green Sunfish, Lepomis Cyanellus,
W77-02697 5C

Effect of the Growth of the West Part of Mexico City on Hydrodynamic Processes (Effet de la Croissance de la Partie Ouest de la Ville de Mexico Sur Les Processus Hydrodynamiques),
W77-02791 4C

Sampling and Analysis of Stormwater Runoff from Urban and Semi-Urban/Rural Watersheds - Systematic Development of Methodologies in Planning Urban Water Resources for Medium Size Communities,
W77-02995 5B

SWAMPS
Impa s of Construction Activities in Wetlands of the United States,
W77-03007 5C

SWITZERLAND
Purification of Waste Waters at Cellulose Attisholz (Epuration des eaux residuaires a la fabrique de Cellulose de Attisholz),
W77-02577 5D

SYNTHETIC OIL
Some Environmental and Toxicological Aspects of Tri-Aryl Phosphate Synthetic Oil,
W77-02724 5C

TAKYR SOILS
Physical and Chemical Properties of Takyr Soils and Changes in Their Agrochemical Properties After Irrigation, (In Russian),
W77-02929 3F

TANKER TERMINALS
Numerical Analysis of Tidal Circulation for Long Beach Harbor; Report 1, Existing Conditions and Alternate Plans for Pier J Completion and Tanker Terminal Study,
W77-02948 8B

Numerical Analysis of Tidal Circulation for Long Beach Harbor; Report 3, Existing Conditions and Alternate Plans for Pier J Completion and Tanker Terminal Study with -82 Ft Channel,
W77-02949 8B

TANNERY WASTES
Investigation of Commercial Chrome-Tanning Systems: Part VI. Full-Scale Trials of Chrome Liquor Recycling and the Importance of Salt Concentration,
W77-02594 5D

Eighth Meeting of the IULTCS Tannery Wastes Commission, Svendborg, Denmark, 21st to 23rd May 1975.
W77-02603 5D

Treating Effluent Containing Compounds Pref. Dyes - By Adding Salt Generator of Opposite Charge to Effluent Ion then Ultra-Filtering.
W77-02612 5D

Air and Water Purification - with Acid Chlorite Solution.
W77-02613 5D

Leather Industry Effluent Purification - By Acidification Prior to Lime Treatment and Separation by Flotation.
W77-02614 5D

The Purification of Industrial Effluent.
W77-02615 5D

TASTE
Purging a Muddy-Earthy Flavor Taint from Rainbow Trout (Salmo Gairdneri) by Transferring to Artificial and Natural Holding Environments,
W77-03023 5G

TELEOSTS
Cellular Effects of Mercury on Fish Kidney Tubules,
W77-02696 5C

TEMPERATURE
Analysis and Control of Thermal Pollution (178) Training Manual,
W77-02632 5B

The Effects of Temperature on Diseases and Their Histopathological Manifestations in Fish,
W77-02692 5C

Effects of Turbidity on Ventilation Rates and Oxygen Consumption of Green Sunfish, Lepomis Cyanellus,
W77-02697 5C

Removal of Toxic Chemicals from Water with Activated Carbon,
W77-02707 5D

Lethal and Preferred Temperatures of the Alewife (Alosa Pseudoharengus) in Lake Michigan,
W77-02710 5C

Aqueous Ammonia Equilibrium Calculations: Effects of PH and Temperature,
W77-02720 5C

The Ecology of an Artificial Cooling Lake,
W77-02723 5C

Plankton Investigations Near Flevo Power Station,
W77-02726 5C

Macrozoobenthic Species Assemblages of Southeastern Lake Michigan, U.S.A.,
W77-02728 2H

Effects of Water Quality on Larval Settlements in Los Angeles Harbor as Determined by Multivariate Statistical Techniques,
W77-02735 5C

1976 Environmental Conditions Relative to Shrimp Production in Coastal Louisiana,
W77-02876 5C

Embryonic Development, Early Growth, and Meristic Variation in Rainbow Trout (Salmo Gairdneri) Exposed to Combinations of Light Intensity and Temperature,
W77-02881 5C

An Appraisal of Ground Water for Irrigation in the Appleton Area, West-Central Minnesota,
W77-02982 4B

Major Aquifers in Hand and Hyde Counties, South Dakota,
W77-02992 4B

Impact of Urbanization on Water Yield, Flood Peak Sediment Yield, and Water Quality in the Berkeley Hills, California,
W77-02999 4C

WATERLOGGING
Waterlogging in an Alluvial Aquifer Near Lake Minnequa, Pueblo, Colorado,
W77-02983 2F

WATERSHEDS (BASINS)
Natural and Human Influence on the Hydrological Cycle in South India,
W77-02777 4D

Man's Impact on Erosion in the Rural Environment: The Indian Experience,
W77-02778 4C

Effects of Man's Activities on Erosion in Rural Environments and a Feasibility Study for Rehabilitation,
W77-02779 4C

Erosion Phenomena in Drainage Basins Reflected by Sediment Flow in Rivers (Phenomenes D'Erosion des Bassins Versants Refletes par les Transports Solides des Cours D'Eau),
W77-02780 2J

Water Erosion and Sediment Discharge,
W77-02783 2J

Predicting Sediment Yield Frequency for Rural Basins to Determine Man's Effect on Long-Term Sedimentation,
W77-02786 4D

Effect of the Growth of the West Part of Mexico City on Hydrodynamic Processes (Effet de la Croissance de la Partie Ouest de la Ville de Mexico Sur Les Processus Hydrodynamiques),
W77-02791 4C

Impact of Urbanization on Water Yield, Flood Peak Sediment Yield, and Water Quality in the Berkeley Hills, California,
W77-02999 4C

WAVE REFLECTION
A Variational Approach to Nonlinear Wave Theory,
W77-02942 8B

WAVES (WATER)
Numerical Modeling of Resonant Oscillations in Deep Draft Harbors,
W77-02935 8B

A Variational Approach to Nonlinear Wave Theory,
W77-02942 8B

Transmission of Wave Energy through and Overtopping of the Long Beach, California, Breakwater; Hydraulic Model Investigation,
W77-02945 8B

Design for Wave Protection, Flood Control, and Prevention of Shoaling, Cattaraugus Creek Harbor, New York; Hydraulic Model Investigation,
W77-02952 8B

Los Angeles and Long Beach Harbors Model Study; Report 3, Analyses of Wave and Ship Motion Data,
W77-02955 8B

WAXES
Laboratory Evaluation of Wax and Silicone for Water Harvesting on Coal Mine Spoil,
W77-02589 3B

WEATHER DATA
Economics of Storm Protection,
W77-02672 6F

Great Lakes Ice Cover, Winter 1974-75,
W77-02677 2C

WEATHER MODIFICATION
Colorado River Basin Pilot Project, Comprehensive Evaluation Report, Five Winter Seasons 1970-71 to 1974-75,
W77-03060 3B

WELL DATA
Records of Wells and Water Quality for the Garber-Wellington Aquifer, Northern Oklahoma and Southern Logan Counties, Oklahoma,
W77-02974 4B

WENONAH-MOUNT LAUREL AQUIFER (NJ)
Digital-Simulation Model of the Wenonah-Mount Laurel Aquifer in the Coastal Plain of New Jersey,
W77-02975 2F

WETLAND
Coastal Zone Boundaries,
W77-02685 2L

WETLANDS
Maryland Uplands Natural Areas Study. Vol I: Eastern Shore,
W77-02690 2I

Maryland Uplands Natural Areas Study. Vol II: Eastern Shore Field Notebook,

Impacts of Construction Activities in Wetlands of the United States,
W77-03007 5C

WHALES
Chlorinated Hydrocarbons in Cetaceans,
W77-03033 5A

WHEAT
Comparison of Irrigation Schedules Based on Pan Evaporation and Growth Stages in Winter Wheat,
W77-02857 3F

Consumption Use and Water Requirement of Dwarf Wheat in Light Texture Soils of Rajasthan,
W77-02860 3F

Anomalous Water Relations in Copper-Deficient Wheat Plants,
W77-02861 2I

Metabolism of Protein and Nucleic Acids During Adaptation to Various Types of Drought, (In Russian),
W77-02926 3F

Combined Effects of Low Oxygen and Salinity on Germination of a Semi-Dwarf Mexican Wheat,
W77-03068 3C

WHITE MOUNTAINS AREA (ARIZ)
A Comparative Water Quality Analysis of Selected Recreation Lakes and Streams in the White Mountains of Arizona,
W77-02866 5B

WHITE PERCH
Effect of Shear on Eggs and Larvae of Striped Bass, Morone Saxatilis, and White Perch, M. Americana,
W77-02714 5C

Reproduction of White Perch in the Lower Hudson River,
W77-03058 2L

WHITE SEA (USSR)
Bloodsucking Mosquitoes (Diptera, Culicidae) of the White Sea Coast: III. Breeding Places of Mosquitoes of the Genus Aedes, (In Russian),
W77-02699 5G

WHITEFISH
Lake Whitefish (Corregonus Clupeaformis (Mitchill) in Southern Indian Lake, Manitoba,
W77-02821 2H

WILDLIFE
The Effects of Freshwater Withdrawals on Fish and Wildlife Resources,
W77-02655 5G

Wildlife and Oil Shale. A Problem Analysis and Research Program
W77-02659 5G

Impacts of Construction Activities in Wetlands of the United States,
W77-03007 5C

WILDLIFE HABITATS
Wildlife and Oil Shale. A Problem Analysis and Research Program,
W77-02659 5G

WILTING
Anomalous Water Relations in Copper-Deficient Wheat Plants,
W77-02861 2I

WILTING POINT
Anomalous Water Relations in Copper-Deficient Wheat Plants,
W77-02861 2I

WIND DRIVEN CURRENTS
Formulas Used to Analyze Wind-Driven Currents as First-Order Autoregressive Processes,
W77-02670 2L

WIND VELOCITY
Estimation of Winds Over the Great Lakes,
W77-02944 2H

WINDS
Probabilistic Trajectory Assessments for Offshore Oil Spills Impacting Long Island,
W77-02689 5B

WISCONSIN
Scanning Thermal Plumes,
W77-02682 5A

WOOD WASTES
Groundwater Pollution by Wood Waste Disposal,
W77-02591 5B

WORLD HEALTH ORGANIZATION
The World Health Organization's Environmental Health Criteria and Air Monitoring Programs,
W77-02845 5G

WYOMING
Wildlife and Oil Shale. A Problem Analysis and Research Program,
W77-02659 5G

A Benthic Survey of Flat Creek and the Salt River Near Thayne, Wyoming,
W77-02807 5C

Fidelity of Thermophilic Blue-Green Algae to Hot Spring Habitats,
W77-03045 5C

YEASTS
Yeasts and Fungi in Marine Environments, (In French),
W77-02904 5B

YELLOW PERCH
Movement of Yellow Perch (Perca Flavescens) and White Sucker (Catostomus Commersoni) in a Nearshore Great Lakes Habitat Subject to a Thermal Discharge,
W77-03027 5C

YELLOWSTONE NATIONAL PARK
Fidelity of Thermophilic Blue-Green Algae to Hot Spring Habitats,
W77-03045 5C

YUGOSLAVIA
Effect of Some Integral Components of Detergents on the Behaviour, Mortality and Damage of Gills of the Larvae of the Species Rhyacophila Fasciata Hag. (Trichoptera), (In Serbo-Croatian),
W77-02893 5C

ZERO DISCHARGE
Municipal Wastewater Recycling: A Strategy for Meeting the Zero Discharge Goal of PL 92-500,
W77-02620 5D

ZINC
Study About the Toxic Action of Zinc on One Summer Old Carp: I. Lethal Concentrations, (In Bulgarian),
W77-02896 5C

Zinc Uptake by Atlantic Salmon (Salmo Salar) Exposed to a Lethal Concentration of Zinc at 3, 11 and 19 C,
W77-03021 5C

Temperature-Induced Changes in Acute Toxicity of Zinc to Atlantic Salmon (Salmo Salar),
W77-03049 5C

ZINC RADIOISOTOPES
Zinc Uptake by Atlantic Salmon (Salmo Salar) Exposed to a Lethal Concentration of Zinc at 3, 11 and 19 C,
W77-03021 5C

ZOONOSES
The Effects of Temperature on Diseases and Their Histopathological Manifestations in Fish,
W77-02692 5C

ZOOPLANKTON

CENTERS OF COMPETENCE AND THEIR SUBJECT COVERAGE

- Ground and surface water hydrology at the Illinois State Water Survey.
- Metropolitan water resources planning and management at the Center for Urban and Regional Studies of University of North Carolina.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Center of the University of Wisconsin.
- Eutrophication at the Water Resources Center of the University of Wisconsin.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.
- Water well construction technology at the National Water Well Association.
- Water-related aspects of nuclear radiation and safety at the Oak Ridge National Laboratory.
- Water resource aspects of the pulp and paper industry at the Institute of Paper Chemistry.

Supported by the Environmental Protection Agency in cooperation with WRSIC

- Effect on water quality of irrigation return flows at the Department of Agricultural Engineering of Colorado State University.
- Agricultural livestock waste at East Central State College, Oklahoma.
- Municipal wastewater treatment technology at the Franklin Institute Research Laboratories.

Subject Fields

- 1 NATURE OF WATER
- 2 WATER CYCLE
- 3 WATER SUPPLY AUGMENTATION AND CONSERVATION
- 4 WATER QUANTITY MANAGEMENT AND CONTROL
- 5 WATER QUALITY MANAGEMENT AND PROTECTION
- 6 WATER RESOURCES PLANNING
- 7 RESOURCES DATA
- 8 ENGINEERING WORKS
- 9 MANPOWER, GRANTS, AND FACILITIES
- 10 SCIENTIFIC AND TECHNICAL INFORMATION

SELECTED WATER RESOURCES ABSTRACTS

VOLUME 10, NUMBER 7
APRIL 1, 1977

The Library of the
APR 26 1977
University of Illinois
at Urbana-Champaign

W77-03076 -- W77-03600
CODEN: SWRABW

SELECTED WATER RESOURCES ABSTRACTS is produced by the Office of Water Research and Technology, U.S. Department of the Interior, and published twice monthly by the National Technical Information Service (NTIS), U.S. Department of Commerce, for the Water Resources Scientific Information Center (WRSIC).

SELECTED WATER RESOURCES ABSTRACTS (SWRA) is available to Federal agencies and their contractors or grantees in water resources research upon request, citing contract or grant number and sponsoring agency. Write: Manager, Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior, Washington, DC 20240.

Some documents abstracted in this journal can be purchased from NTIS. Price codes are given in the entries and a current code-price conversion table is attached to the outside back cover. Other documents are available from originating organizations or authors as indicated in the citation.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from NTIS, 5285 Port Royal Road, Springfield, VA 22161. Annual subscription rates for the North American Continent are: SWRA Journal only, $75; Journal and Annual Indexes, $100; Indexes only, $50. Other addressees, write prices.

SELECTED WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior

VOLUME 10, NUMBER 7
APRIL 1, 1977

W77-03076 -- W77-03600

e Secretary of the U.S. Department of the Interior has de-
mined that the publication of this periodical is necessary in the
nsaction of the public business required by law of this Depart-
ment. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1978.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus.** Each abstract entry is classified into 10 fields and 60 groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on the inside back cover.

Supplementary documentation is being secured from established discipline-oriented abstracting and indexing services. Currently an arrangement is in effect whereby the BioScience Information Service of Biological Abstracts supplies WRSIC with relevant references from the several subject areas of interest to our users. In addition to Biological Abstracts, references are acquired from Bioresearch Index which are without abstracts and therefore also appear abstractless in SWRA. Similar arrangements with other producers of abstracts are contemplated as planned augmentation of the information base.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Research and Technology and other Federal water resource agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

CONTENTS

FOREWORD iii

SUBJECT FIELDS AND GROUPS

Please use the edge index on the back cover to locate Subject Fields and Indexes.

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Nonwater Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

2A. General

CORRELATION ANALYSIS OF HYDROMETEOROLOGICAL DATA,
Central and Southern Florida Flood Control District, West Palm Beach. Environmental Engineering.
A. N. Shahane, D. Thomas, and P. Bock.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 102, No. HY10, Proceedings Paper 12484, p 1561-1572, October 1976. 2 fig, 7 tab, 10 ref, 2 append.

Descriptors: *Correlation analysis, *Statistical methods, Precipitation(Atmospheric), Drainage area, Evapotranspiration, Fourier analysis, Meteoric water, Rainfall, Runoff, Time series analysis, Meteorology, Statistics, Water vapor, Watersheds(Basins).
Identifiers: *Statistical analysis, Variance, Vapor transport, Terrestrial storage.

Mean monthly time series of precipitation, runoff, atmospheric water vapor transport, terrestrial storage, and evapotranspiration for watersheds distributed over the entire continental United States were analyzed by harmonic analysis to compute Fourier coefficients (with first four harmonics) and explained variances. In addition, linear cross-correlation coefficients for 10 combinations of the five time series were computed. The observed spatial variation of these parameters was thought to be useful to those faced with the formulation of statistical models for simulation and prediction applications. (Roberts-ISWS)

RAINFALL IN THE SEYCHELLES 1941 TO 1970,
D. Aspin.
Weather, Vol. 31, No. 2, p 47-56, February 1976. 6 fig, 1 tab, 10 ref.

Descriptors: *Precipitation(Atmospheric), *Rainfall, *Indian Ocean, Islands, Climates, Droughts, Wet seasons, Monthly, Annual, Climatic data, Measurement.
Identifiers: *Seychelles, *Mahe, Moving means, Intertropical Convergence Zone, Standard deviation, Climatic change.

The trend of rainfall by months and years for Long Pier, Victoria, in the Seychelles Group of the Indian Ocean, was studied. It was found that there was only a single monthly maximum (January) and single monthly minimum (July) even though the Intertropical Convergence Zone passes over the island twice each year. It was further found that there has been an increase in annual rainfall from 1940 to 1970 with about the same reliability as mid-latitude stations. Ten-year moving means for each month show that all months except June had an increase in rainfall over the 30-year period. The significance of this rainfall increase in the Seychelles when compared with the decrease in rainfall on the southern margins of the Sahara and the Indian subcontinent was discussed. (Jones-ISWS)

Illinois State Water Survey, Urbana.
N. G. Towery, S. A. Changnon, Jr., and G. M. Morgan, Jr.
Bulletin American Meteorological Society, Vol. 57, No. 9, p 1132-1140, September 1976. 7 fig, 1 tab, 38 ref. NSF GI-37859, ERP75-09930.

Descriptors: *Hail, *Instrumentation, *Measurement, Equipment, Cost, Remote sensing, Radar, Precipitation(Atmospheric), Storms, Ice, Rain, Meteorology.
Identifiers: *Hail sensors, Hailpads, Hail recorders.

The characteristics of commonly used surface hail instruments were reviewed and instruments evaluated. The instruments evaluated were classified into two major categories: integrating and recording. The integrating sensors are relatively inexpensive and provide certain useful hail data. The recording sensors are much more expensive but provide more useful data, including time of hail. The review included the principles of operation, types of data obtained, operational advantages and disadvantages, and approximate cost of each type of instrument. (Sims-ISWS)

Massey Univ., Palmerston North (New Zealand). Dept. of Geography.
R. G. Heerdegen.
Water Resources Bulletin, Vol 10, No 4, August, 1974, p. 813-817. 6 fig, 3 ref. OWRT B-041-PA(5), 14-31-0001-3635.

Descriptors: *Pennsylvania, *Dormancy, Weather data, Hydrologic data, *Seasonal.
Identifiers: *Growing season, *Seasons, *Dormant season, Climatological data, Hydrologic use.

A study was made of the length of the growing and dormant season in Pennsylvania by isoline interpolation from climatological data. Maps of the beginning and ending of the growing and dormant seasons, length of growing season and ratio of growing to dormant season are included. It is suggested that the growing season is a good index of seasonality and that the length of the growing season and the ratio of length of growing to dormant season are good parameters for hydrologic use. It could be concluded that no single date can be assigned to the start of the growing season (six weeks difference State-wide for Summer and four weeks difference for Winter), that no even length can be assigned to the seasons (growing season ranging from four to six months in length) and that four distinct seasons do not exist, but rather there are two major seasons, growing and dormant, between which are short transition periods. RADIO-ECHO LAYERS AND THE RECENT STABILITY OF THE WEST ANTARCTIC ICE SHEET,
Ohio State Univ. Research Foundation, Columbus. Inst. of Polar Studies and Ohio State Univ., Columbus. Dept. of Geology and Mineralogy.
I. M. Whillans
Nature, Vol. 264, No. 5582, p 152-155, November 11, 1976. 4 fig, 38 ref

Descriptors: *Remote sensing, *Model studies, *Ice cover, *Antarctic, Aircraft, Radar, Surveys, Stability, Ice, Cold regions, Glaciers, Glaciology.
Identifiers: *Ice sheets.

A new method for studying polar ice sheets confirmed the generally accepted concepts of ice sheet flow and found that a region near the ice crest of the West Antarctic ice sheet has been stable for about 30,000 yr. During the austral summer 1974-1975, radio-echo sounding flights were conducted in the Antarctic. Equipment was flown in an LC-130 (Hercules) aircraft by the US Navy as part of the United States Antarctic Research Program. A very simple model for the flow of the ice sheet was used. The model results and the radio-echo results are independent. The model was developed before the radio sounding flights were conducted. The simplest and most plausible explanation for the similarity of the calculated isochrons and the radio-echo layering is that the mass-balance, velocity field, and shape of the central portion of the ice sheet have not changed significantly during approximately the past 30,000 years. DELINEATION AND ENGINEERING CHARACTERISTICS OF PERMAFROST BENEATH THE BEAUFORT SEA,
Cold Regions Research and Engineering Lab., Hanover, N. H.
P. V. Sellman, R. Berg, J. Brown, S. Blouin, and E. Chamberlain.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Year Ending March 1976, Vol 12. Geology, p 391-408, April 1976. 1 fig, 55 ref, 2 append. 01-50-22-2313.

Descriptors: *Alaska, *Permafrost, *Cold regions, *Baseline studies, *Resources development, *Environmental effects, Maps, Bibliographies, Sampling.
Identifiers: *Outer Continental Shelf, Oil exploration, Oil development, *Beaufort Sea.

The report was prepared as the mobilization phase for offshore drilling at Prudhoe Bay was being completed. The entire effort to date has involved the planning and mobilization of a drilling and sampling program for the purpose of gathering data on the physical, chemical and thermal properties of permafrost beneath the Beaufort Sea. Therefore, the report deals primarily with activities leading up to the actual data acquisition phase. A preliminary bibliography on subsea permafrost from Soviet literature is included. (Sinha-OEIS)

DISTRIBUTION AND CHARACTER OF ICINGS IN NORTHEASTERN ALASKA,
Geological Survey, Menlo Park, Calif.
D. Harden, P. Barnes, and E. Reimnitz.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Year Ending March 1976, Vol 12. Geology, p 600-625, April 1976. 6 fig, 18 ref.

Descriptors: *Alaska, *Permafrost, *Resources development, *Baseline studies, *Environmental effects, *Water pollution, Ice, Organic compounds.
Identifiers: *Outer Continental Shelf, *River icings, Oil exploration, Oil development, North Slope, Satellite imagery, Braided channels.

An examination of the distribution of river icings seen in ERTS-1 satellite imagery and high- and low-altitude aerial photography of Alaska's North Slope indicates these features are numerous and widespread east of the Colville River and rare to the west. Where icings occur, stream channels are wide and often form braided channels. Their distribution can be related to changes in stream gradient and to the occurrence of springs. Large icings, such as on the Kongakut River, often remain through the summer melt season to form the nucleaus of icings in the succeeding winter. Major icings also are likely to have a profound influence on the nature of permafrost. The map of river icings may serve as a guide to the occurrence year-round flowing water, a sparse commodity in the area. (Sinha-OEIS)

BEAUFORT SEACOAST PERMAFROST STUDIES,
Alaska Univ., College. Geophysical Inst.
J. C. Rogers.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Year Ending March 1976, Vol 13. Geology, p 257-283, April 1976. 4 fig, 11 ref, append. 03-5-022-55.

Descriptors: *Alaska, *Permafrost, *Oil pollution, *Water pollution, *Baseline studies, *Resources development, *Environmental effects, Coasts, Geophysics.
Identifiers: *Outer Continental Shelf, *Seismic refraction, *Offshore permafrost, Petroleum resources, Oil exploration, Oil development, *Beaufort Sea, Ocean bottom.

The known oil reserves along the Beaufort Seacoast coupled with a national need to develop these resources have focused increased attention on the distribution and character of permafrost in that area. Results of work performed at Prudhoe Bay and Pt. Barrow, Alaska during the 1975 summer field season are reported. A high velocity refractor, characteristics of sub-bottom permafrost, was located in Prudhoe Bay near the shore and followed a distance of 1.4 km offshore. The surface of the layer, which dips downward in the offshore direction, ranges in depth from 12 to 20 meters to about 27 to 35 meters. The first depth estimates correspond to a distance of approximately 400 m from shore while the latter correspond to a distance of 1.4 m from shore. The average slope of the permafrost surface is about 0.8 deg, a figure that is in agreement with the results of drilling into the bottom material by Harrison and Osterkamp of the University of Alaska. However, local variations in the surface slope appear to be large, perhaps as much as 10 degrees. Refraction lines in Elson Lagoon near Pt. Barrow did not indicate the presence of ice bonded permafrost within the depth capability of the equipment used (about 30 meters).

DYNAMICS OF NEAR-SHORE ICE,
Cold Regions Research and Engineering Lab., Hanover, N. H.
W. F. Weeks, and A. Kovacs.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Year Ending March 1976, Vol 14. Ice, p 9-50, April 1976. 16 fig, 44 ref, append. 01-3-022-2313.

Descriptors: *Alaska, *Sea ice, *Baseline studies, *Resources development, *Environmental effects, *Hazards, Water pollution, Oil spills, Oil pollution, Pipelines, Cold regions.
Identifiers: *Outer Continental Shelf, Oil development, Petroleum resources, Near-shore ice, Fast ice, Pack ice, Engineering problems, Beaufort Sea, Chukchi Sea.

The purpose of this project is to measure the motions of both the fast ice and the near shore pack ice to see if the motions of the latter can be understood and used to predict the motions of the former. While these measurements are being made a number of other studies will be undertaken on the nature of near shore sea ice (ice structure, ice thickness, bottom scoring, ridge characteristics, grounded ice features). Work is also underway to characterize the variations in near shore pressure ridging by the use of laser profilometry and SLAR imagery. A knowledge of the motion deformation and physical characteristics of both the near-shore pack ice and the fast ice is essential to adequately designing and estimating the hazards associated with a variety of engineering options that may be considered for offshore operations in the near coastal areas of the Beaufort and Chukchi Seas (e.g. construction of gravel islands, structural platforms, causeways, reinforced ice platforms, buried pipelines, or the utilization of the ice sheet itself to carry large, longterm loads). (Sinha-OEIS)

DYNAMICS OF NEAR-SHORE ICE (DATA BUOYS),
Washington Univ., Seattle. Dept. of Atmospheric Sciences.
N. Untersteiner.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Year Ending March 1976, Vol 14. Ice, p 51-57, April 1976. 1 fig. 03-5-022-67.

Descriptors: *Alaska, *Arctic Ocean, *Sea ice, *Meteorologic data, *Baseline studies, *Resources development, *Hazards, Buoys, Measurement.
Identifiers: *Outer Continental Shelf, *Data buoys, *Oceanographic data, *Atmospheric data, *Petroleum resources, *Oil development, Near-shore ice, Fast ice, Data acquisitions, Arctic Ice Dynamics Joint Experiment(AIDJEX), Beaufort Sea, Chukchi Sea.

Twenty ice buoys are to be deployed to gather data on ice movement and oceanographic and atmospheric conditions in the near-shore areas of the Beaufort and Chukchi Seas of the Arctic Ocean. The buoy deployments are to be accomplished in conjunction with field work being conducted by the Arctic Ice Dynamics Joint Experiment (AIDJEX). Four buoys with oceanographic and meteorological sensors were deployed aong the continental shelf break in November, 1975, by NOAA chartered helicopter from Deadhorse, Alaska, and the AIDJEX main ice station in the Beaufort Sea, and eight tracking-only buoys were parachuted from NOAA chartered aircraft in December. Data from the buoys are being received by transmission through the NIMBUS-6 satellite and placed in the AIDJEX Data Bank. (Sinha-OEIS)
W77-03269

STUDY OF CLIMATIC EFFECTS ON FAST ICE EXTENT AND ITS SEASONAL DECAY ALONG THE BEAUFORT SEA COAST,
Colorado Univ., Boulder. Inst. of Arctic and Alpine Research.
R. G. Barry.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Ending March 1976, Vol 14. Ice, p 58-115, April 1976. 9 fig, 5 tab, 7 ref, 4 append. 03-5-022-91.

Descriptors: *Alaska, *Sea ice, *Baseline studies, *Resources development, *Environmental effects, Hazards, Data collections, Cold regions, Water pollution, Seasonal.
Identifiers: *Outer Continental Shelf, *Fast ice, Climatic effects, Oil exploration, Oil development, Petroleum resources, *Beaufort Sea, Synoptic meteorology.

The primary objective of this study was to assess the role of climatic factors in determining the extent and seasonal decay of fast ice along the Beaufort Sea coast. Particular attention was given to synoptic meteorological events during critical phases of the seasonal cycle. Surface morphological categories have been classified. The scheme is intended as the basis for linking satellite-observed surface changes to climatic (and other) factors. Working maps of ice features in the Prudhoe Bay sector during summer 1974 have been compiled. Maps of grey scale information from 1975 LANDSAT frames between 145 and 151 deg W longitude have been prepared. Fifteen representative sample areas of approximately 16 sq. km. each across the mapped area were chosen in an attempt to evaluate the progression of surface reflected radiance through the melt season. The winds indices have been determined for both along-shore and offshore components at Barrow and Barter Island for all months from 1969 to August 1974, but preliminary analysis has concentrated on the winter months. (Sinha-OEIS)

MORPHOLOGY OF BERING NEAR SHORE ICE CONDITIONS BY MEANS OF SATELLITE AND AERIAL REMOTE SENSING,
Alaska Univ., College. OCS Coordination Office.
W. J. Stringer.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Year Ending March 1976, Vol 14. Ice, p 155-250, April 1976. numerous fig, 5 ref. 03-5-022-55.

Descriptors: *Alaska, *Sea ice, *Offshore platforms, *Resources development, *Environmental effects, *Hazards, *Baseline data, Remote sensing, Data collections, Cold regions, Water pollution, Oil spills, Oil pollution.
Identifiers: *Outer Continental Shelf, Petroleum resources, Oil exploration, Oil development, *Bering Sea, Ice conditions, Morphology.

The objective of this study was to develop a comprehensive morphology of ice conditions in the near shore areas of the Bering Sea with special emphasis given to ice conditions which might be hazardous to offshore petroleum exploration and development. The preliminary conclusions are that, unlike ice conditions along the Beaufort coast, ice conditions along the Bering coast are highly variable. Dynamic ice events are possible in the near shore areas during the entire ice season except for the most highly protected bays and inlets. The nature of these events is highly dependent on location and meteorological conditions. The major implication with respect to OCS oil and gas development is that except for a few highly localized areas, it is not possible to depend on a stable sheet of ice from which to conduct exploration and other petroleum related activities. It would follow that all activities including exploration, platform construction, etc would have to be performed during the ice-free season. (Sinha-OEIS)
W77-03272

MORPHOLOGY OF BEAUFORT NEAR SHORE ICE CONDITIONS BY MEANS OF SATELLITE AND AERIAL REMOTE SENSING,
Alaska Univ., College. OCS Coordination Office.
W. J. Stringer.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Year Ending March 1976, Vol 14. Ice, p 251-311, April 1976. numerous fig, 5 ref. 03-5-022-55.

Descriptors: *Alaska, *Sea ice, *Resources development, *Baseline studies, *Environmental effects, *Offshore platforms, *Hazards, Remote sensing, Data collections, Cold regions, Water pollution, Oil spills, Oil pollution.
Identifiers: *Outer Continental Shelf, Petroleum resources, Oil exploration, Oil development, *Beaufort Sea, Ice conditions, Morphology.

The objective of this study was to develop a comprehensive morphology of ice conditions in the near-shore areas of the Beaufort Sea with special emphasis given to ice conditions which might be hazardous to offshore petroleum exploration and development. The preliminary conclusions are that within a certain range of variability, ice conditions along the Beaufort coast are predicatable: for several months a great deal of reliability can be placed on the existence of a stable sheet of ice extending to roughly the location of the 10-fathom contour. The precise location of the stable ice boundary will be determined from the morphology being developed. Beyond this stable ice boundary, dynamic ice events can occur at any time depending largely on meteorological conditions. The im-

plications to OCS oil and gas development are that within the stable ice boundary, for several months of the year, ice conditions are favorable to the use of the ice surface for exploration and other activities. Beyond this boundary conditions become unreliable or predictably hazardous. (Sinha-OEIS)

In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Year Ending March 1976, Vol 14. Ice, p 313-331, April 1976. 3 fig, 8 ref. 03-5-022-55.

Descriptors: *Alaska, *Sea ice, *Resources development, *Baseline studies, *Environmental effects, *Hazards, Failure(Mechanics), Telemetry, Water pollution, Oil pollution.
Identifiers: *Outer Continental Shelf, Oil exploration, Oil development, Petroleum resources, Grounded structures, Ice sheets, Land fast ice, Pack ice, Offshore structures.

The objectives of this study were to measure, in situ, the stresses generated in a sea ice sheet as it fails in the vicinity of a static obstacle and the rate of approach of the ice sheet during this process. The results of the first experiment support the hypothesis that stresses generated by pack ice impingement on land fast ice are low when the motion is predominantly shearing past land fast ice. This implies that at certain times land fast ice may be a safe location for oil exploration or drilling activities. The radio telemetry system developed for the stress sensors provides a particularly convenient method of stress analysis. (Sinha-OEIS)

BEAUFORT SEA, CHUKCHI SEA, BERING STRAIT HISTORICAL BASELINE ICE STUDY,
Alaska Univ., College. Dept. of History.
W. R. Hunt, and C. M. Haske.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Year Ending March 1976, Vol 14. Ice, p 333-385, April 1976. append.

Descriptors: *Alaska, *Sea ice, *Data collections, *Resources development, *Baseline studies, History.
Identifiers: *Outer Continental Shelf, *Ice conditions, *Beaufort Sea, Bering Sea, *Chukchi Sea, Petroleum resources.

The objectives of this study were to collect data on the history of ice conditions in the Beaufort and Chukchi Seas, and Bering Strait, to synthesize this data, and to present the results in report and cartographic form. The source materials examined include the field notes of explorers, journals of coastal residents and traders and some whaling journals. The appendix contains the shore observations from the Alaska File of the Revenue Cutter Service from 1867 to 1914. The most significant observation is the documentation of a probable 26-year cycle of severe ice conditions. (Sinha-OEIS)

DEVELOPMENT OF HARDWARE AND PROCEDURES FOR IN-SITU MEASUREMENT OF CREEP IN SEA ICE,
Alaska Univ., College. Geophysical Inst.
L. H. Shapiro, R. D. Nelson, W. M. Sackinger, and E. R. Hoskins.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Year Ending March 1976, Vol 14. Ice, p 387-407, April 1976. 13 ref. 03-5-022-55.

Descriptors: *Alaska, *Sea ice, *Resources development, *Baseline studies, Creep, Measurement, Hazards, Environmental effects, Instrumentation.
Identifiers: *Outer Continental Shelf, Oil exploration, Oil development, Petroleum resources, Ice conditions, In-situ measurement, Hardware, Strain gauges.

The specific objective of this project was to develop hardware and procedures for the in situ measurement of the creep behavior of sea ice. Any permanent or semi-permanent structures off the Arctic Coast of Alaska must contend with the hazard that sea ice presents to its stability. In order to properly design such installations it is necessary that reliable values of the mechanical properties of the ice be available both for establishing the design of the structure, and for the evaluation of that design by public agencies. In addition, significant savings in cost of construction can be realized if less conservative safety factors can be utilized. The use of steel flatjacks, expanded with nitrogen gas, for loading devices has proved successful in all the tests to date. Similarly, no serious problems have been encountered in the preparation of strain cells although more work is needed, particularly in coarse crystalline ice where the size of the grains may be large enough to distort the strain field in the cell. In addition, there is still a question as to whether small strain gauges will be adequate for testing later in the spring when higher temperatures will permit the strain to become much greater than those encountered to date. However, the basic questions regarding the design of a suitable strain cell appears to have been resolved. (Sinha-OEIS)

THE CLASSIFICATION AND GEOMORPHIC IMPLICATIONS OF THAW LAKES ON THE ARCTIC COASTAL PLAIN, ALASKA,
Cold Regions Research and Engineering Lab., Hanover, N.H. Northern Engineering Research Branch.
P. V. Sellmann, J. Brown, R. I. Lewellan, H. McKim, and C. Merry.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A021 226, Price codes: A03 in paper copy, A01 in microfiche. Research Report 344, December 1975. 25 p, 11 fig, 1 tab, 30 ref.

Descriptors: *Ice, *Permafrost, *Lakes, *Arctic, *Alaska, Remote sensing, Satellites(Artificial), Classification, Thawing, Cold regions, Geomorphology, Geology.
Identifiers: *Thaw lakes, *Arctic Coastal Plains(Alaska), ERTS, Lake morphology.

The lakes of the Arctic Coastal Plain of northern Alaska were classified, based on size, shape, orientation, and distribution, into six lake units and three nonlake units. Regional slope and relief were demonstrated to control lake size. The largest lakes occur on the flattest, northernmost segment of the Coastal Plain. Using ERTS-1 sequential imagery and existing photography and data, lakes were grouped according to three depth ranges, less than 1 m, 1-2 m and greater than 2 m. Deepest lakes have the longest period of summer ice cover. Ice on shallow lakes melts the earliest. Maximum depths of lakes were computed based on ice volume content of the perennially frozen ground (permafrost), and these computations agreed with observed values and ranges. The lake classification and regional ERTS-1 coverage also appear to provide additional information on the limits of late-Pleistocene transgressions on the Coastal Plains. (Sims-ISWS)
W77-03296

STRENGTH OF ICE UNDER MULTIAXIAL LOADING,
Southwest Research Inst., San Antonio, Tex.
J. Lankford, and P. H. Francis.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A01[illegible] 373, Price codes: A02 in paper copy, A01 in microfiche. Final Report 02-4071, September 1975. 10 p, 3 fig, 1 tab, 5 ref. ARO DAHC04-75-C-0002.

Descriptors: *Ice, *Strength of materials, *Laboratory tests, Strength, Compressive strength, Failures, Failure(Mechanics), Pressure, Stress, Ice loads, Analytical techniques.
Identifiers: *Multiaxial loading, Ice strength.

Strength tests were carried out using hollow, cylindrical specimens of polycrystalline ice, subject to combined axial compression, internal/external pressure. A portion of the failure envelope in principal stress space was mapped out and compared with data of other workers. The results of all available multiaxial tests can be fit by a modified Paul first order criterion. (Sims-ISWS)

STRUCTURE OF THE GLACIER CHARLES RABOTS BRE, NORWAY,
Eidgenoessische Technische Hochschule, Zurich (Switzerland). Geologisches Institut, and Eidgenoessische Technische Hochschule, Zurich (Switzerland). Geographisches Institut.
M. J. Hambrey.
Geological Society of America Bulletin, Vol. 87, No. 11, p 1629-1637, November 1976. 10 fig, 1 tab, 40 ref.

Descriptors: *Glaciers, *Glaciology, *Surveys, *Geomorphology, Ice, On-site investigations, Ablation, Folds(Geologic), Stratification, Sedimentary structures, Movement, Foreign countries.
Identifiers: *Norway, *Charles Rabots Bre glacier, Ice fracture, Secondary structures.

Sedimentary stratification, foliation, and crevasse traces (including those of healed crevasses) are well displayed at the surface of the small, steep glacier Charles Rabots Bre. Two main flow units cropping out as convex downglacier arcuate systems of stratification, are recognizable, but others, related to the irregular distribution of the accumulation areas, also contribute significantly to the outcrop pattern. Between the flow units and at the margins of the glacier, strong, steeply dipping longitudinal foliation crops out parallel to longitudinally striking stratification. Much of this foliation is believed to form as a result of shearing and recrystallization in the planes of favorably oriented sedimentary layers. The persistence of crevasse traces below the sets of marginal and transverse crevasses in an area of strong ablation indicates that fracture occurs to greater depths in temperate glacier ice than is generally believed. OMPARATIVE PHOTOSYNTHETIC RODUCTION OF MOJAVE DESERT SHRUBS,
alifornia Univ., Los Angeles. Lab. of Nuclear edicine and Radiation Biology.
A. Bamberg, G. E. Kleinkopf, A. Wallace, and Vollmer.
ology, Vol. 56, p. 732-736, 1975. 3 fig, 2 tab, 11 f.

escriptors: *Transpiration, *Photosynthesis, Desert plants, *Plant growth, *Moisture content, ater loss, Moisture uptake, Deserts, Arid cli-ates, Water requirements, Radiation, Tempera-re, Soil moisture, Stress, Moisture stress, eciduous trees, Adaptation, Energy conversion, nvironmental effects, Soil-water-plant relation-ips, *Shrubs.
entifiers: Mojave Desert shrubs.

ranspiration and net photosynthetic rates of veral species of desert shrubs were measured as function of season and environmental variables the northern Mojave Desert. Many desert plants rry out most or all of their photosynthesis and owth during the favorable periods of the year; owever, a few species have adapted to desert nditions sufficiently to carry on photosynthesis rough the hot, dry summer months. Gas change rates were determined for five shrub ecies under natural field conditions. Water atus, temperature, and radiation were recorded nultaneously with net photosynthesis and trans-ration. The results are presented. Drought-eciduous species, Ambrosia dumosa, Lycium an-rsonii, and Lycium pallidum, had higher max-um rates and greater water loss than the ever-een Larrea tridentata and summer green rameria parvifolia. Results indicate that plant ecies in the northern Mojave Desert have a cultative response to moisture and temperature nditions and during favorable periods exhibit newed photosynthetic activity within a few ys, continuing active gas exchange and growth long as conditions are favorable. The response ries in intensity and length depending on the nount of moisture received and subsequent tem-ratures. Desert plants, with few exceptions, are tremely labile and exhibit large variability and fferent adaptive strategies. (Jamail-Arizona)

entifiers: *Mesophyl.

Experiments were conducted to determine rates of photosynthesis, transpiration and stomatal diffusion resistance to both water vapor and carbon dioxide in six grass species at three carbon dioxide concentrations and four light intensities. The results are presented. They indicate that the water use efficiency in photosynthesis was greater at heading than at tilling growth stage for all species. From an agronomic standpoint, water use efficiency is based on dry matter production and soil water extraction, and is probably best determined under field conditions. The relationship between water use efficiency calculations utilizing dry matter production as compared with calculations based on transpiration-photosynthesis, transpiration, and stomatal characteristics probably strongly affect the productivity of the forage species being grown. (Jamail-Arizona)

CHANGES IN THE TRANSPIRATION RATE AND LEAF WATER CONTENT IN SEVERAL VARIETIES OF CRYPTOMERIA JAPONICA SUBJECTED TO WATER STRESS, (IN JAPANESE),
Government Forest Experiment Station, Tokyo (Japan).
Z. Kishi.
J Jpn For Soc 57(6); p 197-200, 1975.

Descriptors: *Transpiration, *Leaves, *Moisture content, *Water loss, *Drought resistance, *Drought tolerance, Water requirements, Moisture deficit, Moisture stress.
Identifiers: Cryptomeria Japonica, Sanbu, Boka.

The resistance to dryness of 'Sanbu' and 'Boka' cultivars of C. japonica was studied. One-year old plants were raised in pots with 60-80% water and then the watering was stopped. When the moisture began to decrease, the transpiration rate of 'Sanbu' decreased faster than that of 'Boka'. Accordingly the water contents of the leaves decreased more slowly in 'Sanbu' than in 'Boka'. However, when the moisture was severely decreased, 'Sanbu' showed greater decrease in water contents than 'Boka' did. 'Sanbu' generally grows well in a dry area, although it is susceptible to the dryness of winter.

EVAPOTRANSPIRATION REDUCTION BY FIELD GEOMETRY EFFECTS,
Oklahoma State Univ., Stillwater. Dept. of Agronomy.
J. F. Stone, G. N. McCauley, E. W. Chin Choy, and H. E. Reeves.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-262 244, Price codes: A05 in paper copy, A01 in microfiche. Oklahoma Water Resources Research Institute, Stillwater, Completion Report, November 1976. 93 p, 21 fig, 11 tab, 47 ref. Submitted by Oklahoma Agricultural Experiment Station. OWRT B-029-OKLA(1). 14-31-0001-4120.

Descriptors: *Evapotranspiration, *Soil-water-plant relationships, *Transpiration, Water balance, Moisture, Climatology, Air circulation, Advection, Winds, *Peanuts, *Grain sorghum, Cultivation, Energy budget, Moisture availability.
Identifiers: *Row spacing, *Row direction, *Field geometry effects.

The objectives were to identify factors causing peanuts planted in narrow north-south rows to consume less water than in other spacings and orientations and to look for this effect in grain sorghum. Peanuts were studied in 30 and 90 cm rows oriented north-south and east-west. Grain sorghum was studied in 45 and 142 cm north-south rows. Water content of the soil profile was determined by the neutron method and the deep drainage component from the profile was monitored using tensiometers. Micrometeorological conditions were monitored to correlate with evaporative water loss. Energy balance measurements were obtained and the solar radiation, net radiation, advective energy and latent heat of evaporation by the Bowen Ratio were measured and/or determined. Aerodynamic transport coefficients were measured. Grain sorghum in 45 cm rows and peanuts in 30 cm north-south rows had the lowest evapotranspiration (ET) in 5 of 7 periods of measurement. During periods of moderate to high evaporative demand the ET from the narrow-row treatments was heavily influenced by advective energy and some (apparently physiological) effects which caused a depression in ET during the day. North-south rows during high evaporative demand showed evidence of early stomatal closure. Also north-south rows showed signs of generating greater turbulent transfer of heat. This combination seemed to advect heat away during periods of high stress. During periods of low evaporative demand the ET was nearly equal to net radiation and narrow north-south rows were not necessarily the lowest in ET.

Descriptors: *Droughts, *Floods, *Hydrologic data, Hydrology, Markov processes, Probability, Wet seasons, Statistical methods, Dry seasons, Flow, Correlation analysis.
Identifiers: *Probability theory, *Statistical analysis, Annual flow series, Probabilistic properties, Statistical properties, Correlation coefficient.

A methodology for calculating analytically various probabilities and statistical properties of run lengths of annual hydrological data was developed and applied to the first order Markov processes. In deriving the analytical expressions, the sequential property of the Markovian variables, which reduced the multivariate integral equation into multiplication of various bivariate integrals, was used extensively. Tables were provided for the mean variance coefficient of skewness and coefficient of variation of positive run lengths at various truncation levels and first order serial correlation coefficient. It was observed that run length properties of the Markov processes were the functions of truncation level and first order serial correlation coefficient only. As the serial correlation coefficient increased, the positive run length also increased. (Roberts-ISWS)

DEPTH AND FREQUENCY OF FLOODS IN ILLINOIS,
Geological Survey, Champaign, Ill. Water Resources Div.
B. J. Prugh, Jr.
Illinois Department of Transportation, Springfield, Division of Water Resources report, 1976. 26 p, 6 fig, 5 tab, 11 ref.

Descriptors: *Flood forecasting, *Flood frequency, *Flood recurrence interval, *Regression analysis, *Illinois, Channel morphology, Streamflow, Flow rates, Gaging stations, Flood plain zoning, Flood plain insurance, Rainfall-runoff relationships, Natural flow.
Identifiers: *2-, 5-, 10-, 25-, 50-, 100-year floods.

A method is presented for estimating flood depths of 2-, 5-, 10-, 25-, 50-, and 100-year frequency at ungaged sites in Illinois. Data from 177 U.S. Geological Survey gaging sites in Illinois were analyzed by multiple-regression techniques. Equations to predict depth of water above channel bottom for various frequency floods were developed. The 2-year-flood discharge was used as the descriptive variable. The depth-frequency equations assume normal rainfall-runoff relationships and should be used only for Illinois streams flowing under natural conditions. They do not apply to streams affected by backwater, or significant artificial controls, or in situations where ice or debris jams cause peak stages. (Woodard-USGS)

2F. Groundwater

A THREE-DIMENSIONAL FINITE ELEMENT GROUND WATER MODEL,
California Univ., Davis. Water Science and Engineering Section.
S. K. Gupta, K. K. Tanji, and J. N. Luthin.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-248 925, Price codes: A07 in paper copy, A01 in microfiche. UCAL-WRC-C-152, November 1975. 126 p, 24 fig, 5 tab, 127 ref, append.

Descriptors: *Mathematical models, *Groundwater, *Aquifers, *California, Aquifer systems, Computer programs, Groundwater basins, *Finite element analysis, Equations, Groundwater movement, Aquifer characteristics, Dispersion, Diffusion, Boundaries(Surfaces), Mass transfer.
Identifiers: *Galerkin technique, *Core storage, *Sutter Basin, *Three-dimensional models.

The capability of a three-dimensional model developed in this study was demonstrated by applying it to a real world groundwater system of complex geometry, material characteristics, and initial and boundary conditions. The model used three-dimensional isoparametric elements that can be deformed in x, y, and z directions to handle any type of multi-aquifer geometry in a most economical manner, i.e., higher order elements are required for curved boundaries and lower order for the rest of the region. Other highlights and main features are: (1) core storage requirement is reduced to a minimum by using disk or tape, and also by the use of 'compressed' stiffness matrix; (2) parameters repeatedly required are estimated only once and stored on disk; and (3) different conditions encountered in real world problems and transient cases are handled by executing only the pertinent subprograms. PERMEABILITY AND GROUND WATER CIRCULATION IN THE MADISON AQUIFER ALONG THE EASTERN FLANK OF THE BIGHORN MOUNTAINS OF WYOMING,
Wyoming Univ., Laramie. Dept. of Geology; and Wyoming Univ., Laramie. Water Resources Research Inst.
P. W. Huntoon.
In: 28th Annual Field Conference--1976, Wyoming Geological Association Guidebook, p 283-290, 3 fig, 2 tab, 14 ref. OWRT A-019-WYO(3), 14-31-0001-4051,5051,6053.

Descriptors: *Aquifers, *Permeability, *Groundwater recharge, *Wyoming, Groundwater movement.
Identifiers: *Bighorn Mountain range(Wyo), *Madison aquifer(Wyo).

The observed permeability characteristics of the Paleozoic rocks that comprise the Madison aquifer in outcrops along the eastern flank of the Bighorn range are described. The analysis, though qualitative, will help to identify the types of geologic environments in the Powder River Basin where there is potential for ground water production. A second objective is to present in summary fashion the results of quantitative estimates of ground water recharge to the Madison aquifer along the eastern flank of the Bighorn range in Wyoming.

HYDROGEOLOGY OF THE MISSOURI RIVER FLOOD PLAIN NEAR GLASGOW, MISSOURI,
Missouri Univ., Columbia. Dept. of Geology.
N. G. Grannemann.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-262 215, Price codes: A06 in paper copy, A01 in microfiche. M. A. Thesis, December 1976. 98 p, 49 fig, 1 tab, 45 ref, 3 append. OWRT A-085-MO(2). 14-34-0001-6026

Descriptors: *Missouri River, *Flood plains, *Alluvial aquifers, *Mathematical models, Bank storage, *Groundwater, Water levels, Alluvium, Rivers, *Hydrogeology, *Missouri, *Monitoring.

A combination study of field investigation, year-long monitoring of river stage and ground-water conditions, and mathematical modeling provided insights into the unexpected variability of flood-plain hydrogeology. The ground-water system reflects a continuum of change rather than variations from a steady-state condition. Factors controlling ground-water levels are: distance from the river, time since any change in river stage, the geometry of river meanders and valley walls, inhomogeneities in top stratum materials, position of tributary creeks and whether these creeks are influent or effluent, long-term ground-water levels near valley walls, and pumping. It was possible to separate the flood-plain study area into four types of ground-water response: areas of continuing ground-water high, areas of predominantly down valley flow, areas of slow ground-water response, and areas of rapidly fluctuating ground-water levels. River ground-water interactions were found to be predominantly effluent, predominantly influent, or alternating influent-effluent. Examination of field data cast serious doubts on the validity of common bank-storage model assumptions. Major alluvial aquifers are inhomogeneous and may be confined and/or unconfined. Furthermore, the Dupuit-Forcheimer conditions are not valid nor is the assumption of fully penetrating streams. The lower Missouri River Valley alluvium represents a major, but relatively little used aquifer.

the United Kingdom, semi-logarithmic plots of e baseflow recession for streams which partially enetrate aquifers are frequently not single raight line plots. Modeling studies indicated that is behavior, for typical values of aquifer parameers occurs for even the simplest of groundwater stems. The baseflow component arising from ven a simple aquifer should be viewed as a superosition of many, distinct exponential terms. The rigin of these terms was shown to arise purely om the dynamics of groundwater flow. A form of e baseflow recession was used to perform empiral fits to observed data. (Terstriep-ISWS)

lentifiers: *Piney Point aquifer(Del).

he hydraulic properties of the Piney Point Eocene) aquifer and overlying basal silt of the hesapeake Group (Miocene) were determined by 23-day aquifer test conducted at the Danner Farm Well Field of the City of Dover, Delaware. During the test, head changes were monitored continuously in the Piney Point aquifer, overlying Cheswold (Miocene) aquifer, and the intervening confining bed. Based on an analysis assuming leaky artesian conditions, the transmissivity and storage coefficient of the aquifer are 4,100 sq ft/d and 0.00030, respectively. The confining bed hydraulic properties were determined using a combination of the following methods: (1) analysis of drawdown data in the aquifer by the Hantush leaky artesian type curves, (2) determination of hydraulic diffusivity based on the ratio of head changes in the aquifer to head changes in the confining bed, and (3) analysis of head changes in the confining bed by use of theoretical response curves to determine hydraulic diffusivity. Vertical conductivity cannot be determined directly from any one of these techniques. However, combined use of the methods indicated that the vertical conductivity of the confining bed ranges from 0.000040 to 0.000090. The range of values for specific storage is 0.0000030 to 0.0000060/ft. These values will be used in a digital model to determine leakage to the Piney Point aquifer in the Dover area. (Woodard-USGS)

APPRAISAL OF WATER RESOURCES IN THE HACKENSACK RIVER BASIN, NEW JERSEY,
Geological Survey, Trenton, N. J. Water Resources Div.
L. D. Carswell.
Water-Resources Investigations 76-74, June 1976. 68 p, 18 fig, 1 plate, 2 tab, 38 ref.

Descriptors: *Groundwater resources, *Aquifer characteristics, *Well data, *Water yield, *Water quality, *New Jersey, Hydrogeology, Geologic mapping, Groundwater movement, Saline water intrusion.
Identifiers: *Hackensack River basin(NJ), Brunswick formation.

Bedrock in the Hackensack River basin, New Jersey, the Newark Group of Triassic age, is composed of diabase, sandstone, conglomerate, and shale. The Brunswick Formation is the only important bedrock aquifer in the basin. Water occurs in this aquifer in joints and fractures, generally within 200 feet of land surface in lowland areas and within 500 feet in upland areas. Yields of wells tapping the Brunswick are up to 600 gal/min; the median yield is 100 gal/min. The formation is anisotropic; the greatest permeability is parallel to the strike of bedding. The Newark Group is overlain by unconsolidated deposits of Quaternary age. Sand and gravel aquifers locally yield large quantities of water (greater than 300 gal/min) to wells. Water in the Brunswick Formation is relatively low in dissolved minerals in the upper area of the basin. In the lower area, water in the Brunswick is highly mineralized: specific conductance ranges from 579 to 3,480 micromhos per cubic centimeter; chloride ranges from 19 to 755 mg/liter; and sulfate ranges from 87 to 966 mg/per liter. Chemical quality in the lower area is affected by induced recharge of poor quality surface water. Surface water quality is influenced by tidal flooding and disposal of sewage and industrial wastes. (Woodard-USGS)

FACTORS OF SOIL SALINIZATION DURING IRRIGATION IN THE TURAN LOWLAND, (IN RUSSIAN),
V. M. Borovskii.
Izv Akad Nauk Kaz Ssr Ser Biol 13(4), p 1-8, 1975.

Descriptors: *Saline soils, Irrigation, Salts, Soil drainage, Irrigated lands, Drainage systems.
Identifiers: Turan, *USSR.

More than 60% of the irrigated lands of the USSR is located in the Turan lowland, a vast region from the coast of the Caspian Sea to the valley of Ili River on the border of China. The stratum in which water-soluble salts migrate has a thickness up to 100 m. The accumulation of salts in soils, rocks and waters is related with the natural drainage conditions. In regulating the water-salt regime by means of drainage systems and flushings, the salt resources and hydrophysical properties of the entire stratum must be considered.--Copyright 1976, Biological Abstracts, Inc.

ON THE VALIDITY OF THE THEORY OF FLOW IN SATURATED SWELLING MATERIALS,
Commonwealth Scientific and Industrial Research Organization, Canberra (Australia). Div. of Environmental Mechanics.
D. E. Smiles.
Australian Journal of Soil Research, Vol. 14, No. 3, p. 389-395, October 1976. 4 fig, 2 tab, 7 ref.

Descriptors: *Saturated flow, *Soil water movement, *Mathematical studies, *Expansive soils, Hydraulic conductivity, Moisture content, Porous media, Soil physical properties.
Identifiers: Swelling materials.

Recently there has been concern that the reorientation of particles during transient flow of water in a saturated swelling materil might result in the hydraulic conductivity and capillary potential not being well-defined functions of the water content. If this were the case, the conventional theory of one-dimensional liquid flow in these materials would be invalid. It is shown that the hydraulic conductivity - water content relationship calculated using physically based approximate theory applied to outflow data obtained from red mud, is single-valued and independent of initial water content. Furthermore, the relationship permits recalculation, using a correct iterative procedure, of the data from which it was derived. It is concluded that the data provide no evidence to reject the theory, and that particle reorientation, if it occurs, is parameterized by the water content. (CSIRO)

INFILTRATION AND WATER MOVEMENT IN AN IN SITU SWELLING SOIL DURING PROLONGED PONDING,
Commonwealth Scientific and Industrial Research Organization, Canberra (Australia). Div. of Environmental Mechanics.
T. Talsma, and A. van der Leij.
Australian Journal of Soil Research, Vol. 14, No. 3, p. 337-349, October 1976. 8 fig, 2 tab, 18 ref.

Descriptors: *Infiltration, *Soil water movement, *Expansive soils, Soil physical properties, Soil density, Soil moisture, Hydraulic conductivity, Tensiometers.
Identifiers: Swelling soils.

Measurements of infiltration, moisture content, soil water potential, hydraulic conductivity, bulk density, vertical swelling, and the effect of overburden on tensiometer readings, were made over 120 days on a swelling clay soil ponded for rice growing. Infiltration was rapid and water penetrated deeply on the first ponding day. Measured infiltration from 1 to 45 days after ponding corresponded well with theoretical expectations. From 45 to 120 days, the development of a time-variable flow restriction near the soil surface prevented the attainment of a final, steady infiltration rate. During ponding a transient water table developed, moisture profiles were distinctly hydric, and seepage to a deep water table or aquifer was not negligible. Core sample values of hydraulic conductivity agreed with those obtained from mean flux and potential gradients, although conductivity and infiltration rate varied greatly from place to place. Measured swelling agreed favourably with that calculated from bulk density changes. Indications were obtained that the effect of overburden potential on flow was not large. (CSIRO)

SIMULATION OF FIELD WATER UPTAKE BY PLANTS USING A SOIL WATER DEPENDENT ROOT EXTRACTION FUNCTION,
Institute for Land and Water Management Research, Wageningen (Netherlands).
R. A. Feddes, P. Kowalik, K. Kolinska-Malinka, and H. Zaradny.
Journal of Hydrology, Vol. 31, No. 1/2, p 13-26, September 1976. 10 fig, 1 tab, 16 ref.

Descriptors: *Mathematical models, *Absorption, *Soil-water-plant relationships, *Soil water, *Root systems, Root zone, Pressure head, Hydraulic conductivity, Moisture content, Water balance, On-site data collections, Depth, Equations, Aeration, Soil water movement, Soil gases, Water table, Numerical analysis.
Identifiers: Sink term, Empirical function, Implicit finite-difference model, Oxygen diffusion rate.

Water uptake by roots can be represented by adding a volumetric sink term to the continuity equation for soil water flow. This sink term is often expressed as a product of the difference in pressure head between the soil and the root - soil interface, the hydraulic conductivity of the soil, and some empirical root function. Because of the amount of field work and experimental difficulties involved in determining this root function, an attempt was made to describe the sink term with a simpler expression. In this approach, the sink term was considered to be a function of the soil water content, varying with the latter according to the pressure heads generally known to be critical for water uptake by the roots. An implicit finite-difference model was developed and verified with results obtained experimentally in the field from water balance studies. Although the model does not predict the distribution of soil water content with depth in very accurate detail, the cumulative effect over the entire depth is properly simulated. Comparison of the results of the simpler model with those of the model of Feddes, Bresler, and Neuman, led to the conclusion that both models yield similar results. (Visocky-ISWS)

MEASUREMENT OF NONEXCHANGING PORES DURING MISCIBLE DISPLACEMENT IN SOILS,
Massachusetts Agricultural Experiment Station, Amherst.
O. L. Weeks, G. L. Stewart, and M. E. Weeks.
Soil Science, Vol. 122, No. 3, p 139-144, September 1976. 3 fig, 6 tab, 7 ref.

Descriptors: *Porosity, *Soils, *Analytical techniques, *Instrumentation, Measurement, Soil types, Tritium, Tracers, Diffusion, Pores, Vacuum drying, Distillation.
Identifiers: *Miscible displacement, *Effective porosity, Soil columns.

A simple tritium tracer-vacuum distillation technique was used to determine the percent nonexchanging pores in soils during miscible displacement. Data for soil columns packed with three different soil types were presented and compared with the results of previously reported values. After two pore volumes of displacement, only 1 to 2% of the pore water had not exchanged with the displacing fluid. Previously published work, based upon either mathematical models or experimental data, showed considerably greater values for nonconducting pores in soils. The time required for two pore volumes of displacement in the packed soil columns was sufficient for diffusion of tracer into essentially all of the slowly conducting and nonconducting pores. (Visocky-ISWS)

Identifiers: *Bluffs, *Bluff erosion.

This report is the second volume of four dealing with the Illinois Coastal Zone Management Program. Included in this particular report are physical data prepared by the Illinois State Geological Survey for the time period FY1975. Included in the report are seven studies on different aspects of the Lake Michigan-Illinois shoreline. The studies offered data on the following: beach distribution and condition, distribution and levels of erosion, conditions of shore stability, distribution and kinds of shore protection, and areas and conditions of hazard. These categories were subdivided and grouped by political units, thereby providing a summary of shore conditions and problems for each community. All of the studies reported here continue along with the new projects begun in FY1976. (See also W76-12686) (Sims-ISWS)

Identifiers: Lake of the Arbuckles(Okla), Ham's Lake(Okla).

A 1.83 m pump was used to destratify a 40 ha lake (Ham's Lake, Oklahoma) which was 9.5 m deep. This 1 hp device was able to destratify the lake in about one week. The effects of the pump operation on physicochemical variables were determined. Algae species composition and density, zooplankton species composition and diversity, benthic macroinvertebrates species composition, diversity and density, and the distribution and growth of fish were measured. A 5 m pump was used on a lake (Lake of the Arbuckles, Oklahoma) with 23 times the area and 3 times the depth of Ham's Lake. The same parameters were measured. The device caused the lake to turnover 1 month earlier and more completely than in previous years. This pump has the capability of increasing the oxygen content of waters being released without destratifying a lake.

Australian Journal of Marine and Freshwater Research, Vol. 27, No. 3, p. 359-366, September 1976. 3 fig, 4 tab, 32 ref.

Descriptors: *Saline lakes, *Water chemistry, *Australia, Surface waters, Ions, Surveys, Lagoons, Salinity, Climates.
Identifiers: *Tasmania.

Within a large area of Tasmania, described as the sub-humid province, annual evaporation exceeds precipitation, so that closed saline lakes may occur. Analyses are presented of the major chemical features of pans and lagoons within this region. The waters sampled are classed as fresh or saline, using a criterion which is a function of relative ionic composition. Saline waters are regarded as having ionic composition limited by the solubility of alkaline earth carbohydrates, and they have a composition akin to that of sea water. The fauna of salt pans is briefly mentioned, and some relationships between ionic concentrations and other chemical parameters are reassessed for the entire salinity range of Tasmanian inland waters. Australian Journal of Marine and Freshwater Research, Vol. 27, No. 3, p. 367-377, September 1976. 6 fig, 3 tab, 28 ref.

Descriptors: *Saline lakes, *Australia, *Ions, Salinity, Water chemistry, Seasonal, Variability, Ecology, Physicochemical properties.
Identifiers: *Victoria.

Variability is the most salient feature of the physicochemistry of inland salt lakes, and is of fundamental ecological importance. As differences in ionic proportions have an influence on some components of the faunas of salt lakes, an investigation was undertaken to assess seasonal variation in some saline Victorian lakes whose ecology is also under study. Samples taken approximately monthly over a four-year period show that although total salt concentration varied widely in all lakes the ionic proportions of major cations and anions were remarkably constant. Descriptors: *Water level fluctuations, *Lakes, *Winds, Waves(Water), Lagoons, *Australia, Mathematical studies.
Identifiers: Shallow lagoons.

Use is made of the concept of the frequency response function to analyse long-wave oscillations of the surface of a closed lake which is subject to forcing by tangential wind stresses. By comparison of a response function calculated from data taken from the North Coorong - an almost land-locked lagoon south of Adelaide, South Australia - with the theoretical, one-dimensional response calculated for a rectangular, constant-depth lake with dimensions equivalent to the average dimensions of this body of water, an estimate is made of the damping parameter for the lagoon. Predictions of wind-induced water level changes using the response function method agree well with recorded values. (CSIRO)

Descriptors: *Predation, *Rainbow trout, *Mo studies, *Daphnia, Diptera, Prey fish, Compe tion, Secondary productivity, Ecology, Inv tebrates, Lakes, Simulation, Mathemati models, Zooplankton, *Michigan.
Identifiers: *Sporley Lake(Mich), Cascadi models.

Simulated application of a mathematical casca model of size-selective predation shows that t introduction of rainbow trout into Sporley La Michigan cannot be blamed for an observ demise of the lake's Daphnia population. The fin ing supports earlier research suggesting that oth fish entering the lake at the same time as the tro must have played an important role in the dyna ics of the Daphnia. The mathematical casca model is a population projection matrix in whi future population sizes and age structures can projected -- given the size, fecundity and survivo ship of each age class of a starting population. T model attempts to show how the preference predatory fish to feed on larger and older egg-bea ing species, compared with the preference of v vertebrate predators such as Chaeborus f smaller and younger zooplankton, affects a structure and numbers of a single species of pr population. A predation cascade is described, i cluding fish feeding preferences, changes in pred tion as related to decreasing numbers of availab prey, secondary and lesser instar preferences predators and parameter values. Application of t model shows there are age distributions chara teristic of constant growth rate and there are oth distinct age distributions characteristic of crashi populations or of particular portions of oscillati populations. 2I. Water In Plants

EFFECT OF WATER STRESS ON THE PHASIC DEVELOPMENT OF ANNUAL MEDICAGO SPECIES,
Queensland Dept. of Primary Industries, Warwick (Australia).
N. M. Clarkson, and J. S. Russell.
Australian Journal of Agricultural Research, Vol. 27, p 227-234, 1976. 2 fig, 2 tab, 16 ref.

Descriptors: *Moisture stress, *Soil water, *Soil-water-plant relationships, *Crop response, Moisture content, *Alfalfa, Stress, Moisture, Soil types, Clays, Soil chemistry, Chemical properties, Wilting, Growth stages, Field capacity, Crops.
Identifiers: *Phasic development(Alfalfa).

The extent to which water stress affects the phasic development and growth of annual medics is of considerable importance in assessing the yield and survival potential of cultivars in subtropical eastern Australia. The effects of water stress on the phasic development of six annual Medicago species were examined in a laboratory experiment where plants were grown from seed to maturity under four different watering regimes. The phasic development of the plants was examined at 2-day intervals. Stress was varied by allowing the soil to dehydrate to different degrees before rewetting, the cycles being repeated continuously. The results presented suggest that annual medics have no mechanisms for evading dry seasonal conditions by earlier flowering, but once flowering has begun phasic development is accelerated in some species by water stress. The implications of this research for the interpretation and prediction of field behavior of annual medics are that water stress can affect phasic development mainly through a delay in flowering. However, those effects appear to be small compared with those due to vernalization, photoperiod and temperature. (Jamail-Arizona)

A COMPARISON OF SEASONAL PRIMARY PRODUCTION OF MOJAVE DESERT SHRUBS DURING WET AND DRY YEARS,
EG and G Environmental Consultants, Denver, Colo.
S. A. Bamberg, A. T. Vollmer, G. E. Kleinkopf, and T. L. Ackerman.
The American Midland Naturalist, Vol. 95, No. 2, p 398-405, April, 1976. 2 fig, 2 tab, 18 ref.

Descriptors: *Photosynthesis, *Desert plants, *Primary productivity, *Plant growth, Carbon dioxide, Moisture stress, Moisture content, Water requirements, Energy conversion, Stress, Transpiration, Terrestrial habitats, Rainfall, Precipitation(Atmospheric), Arid climates, Ecosystems, *Shrubs.
Identifiers: *Mojave Desert shrubs.

The net primary production of Mojave Desert shrubs during two seasons is compared with contrasting moisture conditions using both a destructive harvest technique and gas exchange measurements throughout the growing season. Net primary production estimates of desert shrubs were determined by carbon dioxide exchange and harvest methods at the Nevada site. Gas exchange rates were measured on shrubs under natural field conditions using a modified Siemens null-point chamber. Production gains varied among species depending on whether the species was favored by the cool, moist spring of 1973. Lycium andersonii and Lycium pallidum, which have high photosynthetic rates and start growth in the early spring, showed the greatest increases. Larrea tridentata and Krameria parvifolia, species adapted to growing under warmer, drier conditions, exhibited the smallest changes in production. Ambrosia dumosa, which has high photosynthetic rates but responds more favorably to warmer spring temperatures than the Lycium species, had moderate production gains. Reasons for the different estimates obtained by the two methods are discussed and evaluated. (Jamail-Arizona)

WATER STRESS INDUCED ALTERATIONS OF THE STOMATAL RESPONSE TO DECREASES IN LEAF WATER POTENTIAL,
Texas A and M Univ., College Station. Dept. of Soil and Crop Sciences.
K. W. Brown, W. R. Jordon, and J. C. Thomas.
Physiologia Plantarum, Vol. 37, No. 1, p 1-5, 1976. 4 fig, 27 ref.

Descriptors: *Stomata, *Moisture stress, Osmotic pressure, *Moisture deficit, *Moisture tension, Leaves, Stress, Moisture, Growth chambers, Cotton, Soil water, Moisture content, Plant growth, Plant physiology, Photosynthesis.
Identifiers: *Leaf water potential, Stomatal response.

An experiment was conducted to document adjustments in stomatal response to leaf water potential of cotton resulting from preconditioning water stress and to investigate the mechanism responsible for any adjustment found. Young growth-chamber cotton plants were subjected to a series of eight periods of soil water stress, which served as a preconditioning treatment. After preconditioning, water was withheld and changes in the stomatal resistance and leaf water potential were determined and compared with similar well watered control plants. Results indicate that the stomatal response of stress-preconditioned plants adjusted significantly. The resistance -- leaf water potential relation for the adaxial surface, was unaltered by the preconditioning treatment. Adjustment of the osmotic potential of guard cells on the abaxial surface provides at least a partial explanation of this change in response. The lack of adjustment of stomatal response on the adaxial surface of the leaves was correlated with a lack of adjustment in osmotic potential of guard cells on that surface. (Jamail-Arizona)

CULTIVATION AND BREEDING OF OENOTHERA-PLANT: IV. EFFECT OF SOIL MOISTURE ON GROWTH AND COMPONENTS IN SEED OF O. BIENNIS, (IN JAPANESE),
Nagasaki Univ. (Japan). Faculty of Pharmaceutical Science.
N. Skokyu, I. Watanabe, J. Fujimoto, and H. Ohashi.
Syoyakugaku Zasshi 28(2), p 134-138, 1974.

Descriptors: *Soil moisture, *Plant growth, Plant physiology, Plant growth regulators, Methodology, Resistivity.
Identifiers: Breeding, Linolenic-acid, Oenothera, *Oenothera-biennis, Seed oil.

The weight method and the electric resistance method (using the watering controller) were used. Soil moisture is expressed as percentages of water capacity. Soil moisture was better controlled by the watering controller than by the weight method. Most suitable for plant growth and greatest seed yield was 60-40% soil moisture. Content and quality of seed oil were influenced little by soil moisture. When soil moisture. When soil moisture was extremely reduced the value diminished. Soil moisture of 60-40% increased oil yield and gamma-linolenic acid.--Copyright 1976, Biological Abstracts, Inc.

REPRODUCTION BY ADFLUVIAL SALMONIDS IN SPAWN CREEK, CACHE COUNTY, UTAH,
Utah State Univ., Logan. Coll. of Engineering.
D. R. Bernard.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-262 222, Price codes: A06 in paper copy, A01 in microfiche. Masters Thesis in Wildlife Science, 1976. 89 p, 28 tab, 9 fig, 56 ref. OWRT B-105-UTAH(2). 14-31-0001-4135.

Descriptors: *Fish reproduction, Aquatic habitats, Water temperature, *Salmonids, *Utah, *Fish migration, *Trout, Brook trout, Brown trout, Cutthroat trout, Watershed management, Growth rates, Streams.
Identifiers: *Adfluvial salmonids, *Spawn Creek(Utah), Cache County(Utah).

This study concerned the migration and production of indigenous populations of brown, brook, and cutthroat trouts in Spawn Creek, Cache County, Utah for the years 1973 and 1974. Important characteristics of Spawn Creek and its watershed were described, including the prevalent, aquatic taxa of fauna and flora. A two-way fish trap and electro-fishing gear, were used to collect data for periodic estimates of mean weight and density stratified by year classes. The estimates of density were obtained through a modified form of the two-catch removal estimator. Mathematical models to describe the time-dependent growth and density were constructed from the von Bertalanffy equation and the equation of depensatory mortality by adding trigonometric components to each. The periodic estimates from the data showed that several year classes such as the 1971 year class of cutthroat trout and the 1970 and 1971 year classes of brook trout, were numerically dominant in 1973 but not in 1974. Immigration occurred seasonally with the adult cutthroat trout migrating in the spring, and the juvenile cutthroat and brown trouts moving in the fall. Migration of brook trout was not significant. Production was greater in the growing season of 1973 than in 1974 for all species. The failure of the brook trout to produce new dominant year classes was attributed to the evacuation of beaver and the subsequent dilapidation of their ponds.

Identifiers: Beach pads.

The level of Lake Michigan rose markedly and rapidly in the decade 1964-1974. Theoretically, a significant rise in lake level is accompanied and followed by an important increase in beach erosion; much or most of the sand eroded should be carried offshore, rather than in the littoral drift system. Computer simulation, measures of erosion rates on air photos, depletion of an artificial sand stockpile, beach pad histories, and other studies indicated that the theoretical effects have also been the actual results. The theoretical projection was confirmed. The importance of transverse transport (more or less at right angles to littoral transport) in the study area points up the fact that presently known types of coastal defense works, largely designed with littoral drift in mind, may not be effective on segments of coast where water levels are rising or have recently risen significantly. Although littoral drift in the study area has been limited, it has operated clearly in the form of 'beach pads', discrete masses of sand which move at measurable rates. Beach pads were derived from an artificial stockpile of sand, but, in this case, not from erosion of the natural dunes. Each beach pad, with its associated bar, furnishes a diagonal path along which sand is transported from the beach into deeper water under oblique wave attack. The amount of sand moved offshore in this way is not measured by considering the migration rate of the pads. (Humphreys-ISWS)

riptors: *Rainwater, *Water chemistry,
tralia, Chemical properties, Ions, Sodium,
rides, Calcium, Sulfur, Seasonal, Pollutant
ification.
ifiers: *Townsville(Qld).

water samples collected over two years at two
near Townsville have been analysed. The
ts differ from those obtained at other sites in
ralia in that the deposition of sodium and
ide was relatively low, the sodium to chloride
was below that of seawater, and the samples
enriched with sulfur and calcium in relation
awater. A feature of the rainwater composi-
is the marked seasonal variation in the con-
ation of all ions, much higher values being
ned in out-of-season rains than during the wet
n, but the ionic ratios were not sensitive to
easonal distribution of rainfall. A common
e for the 'excess' ions present in the rain-
could not be established. (CSIRO)

ECTS OF THE CHEMICAL VARIABILITY
SOME TASMANIAN INLAND WATERS
TRALIA),
ania Univ., Hobart (Australia). Dept. of
ny.
Buckney.

Australian Journal of Marine and Freshwater Research, Vol. 27, No. 3, p. 351-358, September 1976. 5 fig, 2 tab, 14 ref.

Descriptors: *Variability, *Water chemistry, *Surface waters, *Australia, Lakes, Ions, Salinity, Climates, Surveys, Geology, Lake morphology, Pollutant identification.
Identifiers: *Tasmania.

Inland waters may change substantially in chemical content in a short time; variability in total concentration and in the relative proportions of the major dissolved constituents are probably the main factors distinguishing inland waters as chemical systems from oceanic waters. There is, however, little information on the extent to which a water may be expected to vary chemically. A study of 25 Tasmanian waters has described their chemical variability and assessed the main factors contributing to it. The standard deviations of total concentration and ionic concentrations was found to be proportional to a power of the mean concentration. Stoichiometric variability is low in saline waters and can be high in fresh waters. Climate is recognised as being of primary importance as a factor in variability, though morphometric characters exert an influence. Geological conditions are an important factor in determining stoichiometric variability. (CSIRO)

Australian Journal of Marine and Freshwater Research, Vol. 27, No. 3, p. 379-397, September 1976. 3 fig, 6 tab, 38 ref.

Descriptors: *Surface waters, *Australia, *Saline lakes, *Ions, Salinity, Sodium, Chlorides, Water chemistry, Lakes, Streams, Standing waters.

The results of previous investigations, mainly in Eastern Australia, have established that a major feature of Australian inland waters is high salinity with a predominance of sodium and chloride ions in saline waters. Less evidence has been available on the chemistry of waters in South Australia and Western Australia. Numerous analyses of waters in these areas are presented and discussed. In three areas of South Australia, salinities were high, with sodium and chloride ions dominant; in the southwest of Western Australia, the pattern in both rivers and standing waters was similar, though in this region there were freshwater lakes and streams of low salinities. In running and standing waters of Northern Australia, by contrast, salinities were low and there was no consistent pattern of ionic dominance. (CSIRO)

Identifiers: *Honey Lake Valley(Calif).

Major element, minor element, and gas composition data are tabulated for 15 springs and wells in Honey Lake Valley, California. Wendel and Amedee hot springs issue Na-S04-C1 waters at boiling or near boiling temperatures; the remaining springs and wells issue Na-HC03 waters at temperatures ranging from 14 to 33 deg C. Gases escaping from the hot springs are principally nitrogen with minor amounts of methane. The geothermometers calculated from the chemical data are also tabulated for each spring. (Woodard-USGS)

Identifiers: Neutrally buoyant floats.

Horizontal and vertical currents in the front along the edge of the continental shelf south of New England during the late spring were measured by tracking special, neutrally buoyant floats which tagged different water masses. The mean current (10-20 cm/s) was westward along the shelf and was confined completely to the overlying shelf water with a geostrophic transport of about 0.7 sverdrups between the 80- and 300-m isobaths. No mean cross-shelf or vertical currents could be reliably measured. Higher frequency currents were detected and were described in this paper. Numerous conductivity-temperature-depth lowerings were made over the drifting floats to examine the interleaving process and possible mixing between shelf water and slope water. It was found that the layers are thinned by vertical shear, and they gain and lose both heat and salt on a time scale of 1-3 days. This, plus the rich microstructure, suggests the existence of vertical turbulent exchange between layers having a turbulent diffusivity of the order of 5 sq cm s. Estimates of net annual heat and salt input to the shelf were made, and they appear to be significant in determining the heat and salt budget of the shelf water mass. (Sims-ISWS)

THE BOTTOM BOUNDARY LAYER OF THE DEEP OCEAN,
Woods Hole Oceanographic Institution, Mass.
L. Armi, and R. C. Millard, Jr.
Journal of Geophysical Research, Vol. 81, No. 27, p 4983-4990, September 20, 1976. 4 fig, 30 ref. ONR N00014-66-C0241, NSF GX-29054.

Descriptors: *Boundary layers, *Atlantic Ocean, *Salinity, *Temperature, Water temperature, On-site investigations, Mixing, Water circulation, Ocean circulation, Currents(Water), Current meters, Turbulence, Velocity, Oceanography.
Identifiers: *Bottom boundary layer, *Hatteras Abyssal Plain, Profiles.

Some aspects of the bottom boundary layer of the deep ocean were exhibited in profiles of salinity and temperature made with a Woods Hole Oceanographic Institution/Brown CTD microprofiler. Profiles from the center of the Hatteras Abyssal Plain have a signature that is characteristic of mixing a uniformly stratified region. Over rough or sloping topography to the east and west of the abyssal plain, the profiles have more complicated structure. All profiles show a well-mixed layer above the bottom; the penetration height of the layer varies from about 10 to 100 m and is correlated with the one-day mean velocity, inferred from current meters located above the bottom boundary layer. Over the Hatteras Abyssal Plain, the mixed layer extends above the bottom about 6 times the turbulent Ekman layer height. Over rough and sloping topography, the penetration height is between the Ekman layer height and the height observed on the flat abyssal plain. (Sims-ISWS)
W77-03089

HIGH-WAVE CONDITIONS OBSERVED OVER THE NORTH ATLANTIC IN SEPTEMBER 1961,
Chicago Bridge and Iron Co., Plainfield, Ill. Marine Research and Development.
S. K. Chakrabarti.
Journal of Geophysical Research, Vol. 81, No. 27, p 4991-4994, September 20, 1976. 4 fig, 11 ref.

Descriptors: *Waves(Water), *Ocean waves, *Atlantic Ocean, Storms, Winds, Data processing, Analytical techniques, Energy, Oceans, Ships, Oceanography.
Identifiers: *Spectral analysis, Wave spectra, Wave energy, High-wave conditions.

The Ocean Weather Ship 'Weather Reporter,' underway from the United Kingdom to assume her position at station J (near 53 deg N, 18 deg W) on the North Atlantic, encountered heavy seas over a 4-day period from September 12-15, 1961. The ship measured the sea state during this period with a shipborne wave recorder at 3-hour intervals. The wave energy spectra were computed from these records and were presented in this paper. The upper and lower confidence limits in the estimation of these energy spectra were discussed. Such statistical quantities as the significant wave height and the average period were presented. (Sims-ISWS)

TIME-DEPTH VARIATIONS IN TIDAL FLUX OF SUSPENDED MATTER IN THE SAINT LAWRENCE ESTUARY,
McGill Univ., Montreal (Quebec). Marine Sciences Centre.
B. d'Anglejan, and R. G. Ingram.
Estuarine and Coastal Marine Science, Vol 4, No 4, p 401-416, July 1976. 8 fig, 15 ref.

Descriptors: *Estuaries, *St Lawrence River, *Suspended solids, *Tidal effects, *Canada, Suspended load, Sediments, Sedimentation, Turbidity, Tides, Currents(Water), Water circulation, Settling velocity, Stratification.
Identifiers: *Total suspended matter, *Advection, *Resuspension, Tidal cycles.

An investigation of the factors controlling the variability of suspended matter concentration at different sites in the St. Lawrence River estuary indicated that advection is much more important than local resuspension over the semi-diurnal tidal cycle. This finding is in contrast to that observed in shallower estuaries. All stations exhibit mid-depth maxima in suspended matter concentration. The occurrence of these maxima corresponds approximately to the end of the ebb flow. Variations from this pattern are attributable to large cross-channel flow. Calculated values of suspended matter flux were used to explain the time and depth variations of suspended matter concentrations. (Bender-ISWS)

tion, Oil development, Petroleum resources, Cur-
rent measurements, Beaufort Sea.

The general objective of this research is to provide
long-term Eulerian time series of currents at
selected locations on the outer shelf and slope of
the Beaufort Sea, so as to describe and understand
the circulation and dynamics of the outer shelf and
slope. The time series must be long enough to
define the important temporal scales of motion.
The area is ice-covered throughout the year, so
that the specific objective must be to recover the
current measurements from anchored arrays
despite the presence of ice. Long-term direct cur-
rent measurements are necessary to describe and
understand the circulation on the shelf and the
exchange between the shelf and the deep Arctic
Ocean. This circulation and exchange are physical
mechanisms which transport and disperse pollu-
tants and substances of biological and geological
importance. The water motion also influences the
ice distribution. (Sinha-OEIS)

Beaufort Sea, Canadian Basin, Pycnocline.

Through a series of CTD sections across the Beau-
fort Sea shelf the seasonal hydrographic sequence
was traced through the fall and winter. Several
features all combine to strongly suggest that
beginning in the fall, the north Alaskan shelf is in
fact feeding water into the pycnocline region of
the Arctic Ocean and contributing to the tempera-
ture structure which is characteristic of the lower
Arctic Water of the entire Canadian Basin.
Oceanographically, the Beaufort shelf is much like
the deep Canadian Basin, however, it appears that
there is a regard in which the Beaufort shelf is of
distinct and considerable oceanographic sig-
nificance, viz. that it very likely constitutes a
source of subsurface waters for the Canadian
Basin. Should this be the case, it can possibly
spread a variety of substances from the shelf into
the Arctic Ocean pycnocline. In other words,
spreading from the shelf is not necessarily con-
fined to the surface layers. (Sinha-OIIS)

Identifiers: *Outer Continental Shelf, Oil exploration, Oil development, *Wave climates, *Wave refraction, *Wave energy, Coastal dynamics, Longshore currents, *Gulf of Alaska.

Analysis of the climatology and physical oceanography of the northeast Gulf of Alaska provides a predictive model for wave height and longshore sediment transportation along the coastline between Yakutat and Cape Suckling. The relationships between the offshore wave climate, the bathymetrically controlled patterns of refraction and the resulting shoreline variability in physical processes have been emphasized. Field observations of coastal morphology, sediment dispersal trends and breaker parameter variability were made in July and August of 1975. Despite the absence of many major storm episodes during the field season, the observed processes correlate well with the sediment distribution in all environments except on high-level storm berms and washover terraces at the east Malaspina Foreland where occasional storms induce a sediment transport direction opposite to that of the dominant conditions. The wave climate model and field observations demonstrate a general westward transport of sediment on the exposed beaches of the northeast Gulf of Alaska. Reversals of this trend are observed on the west side of Icy Bay and Yakutat Bay where the net transport direction is towards the northeast, i.e., towards the head of the bays. As an introduction to the study area figures provide a LANDSAT-satellite view and seven high-altitude oblique air photos of the coastal zone from Cape Yakataga to Yakutat Bay. (Sinha-OEIS)

THE ENVIRONMENTAL GEOLOGY AND GEOMORPHOLOGY OF THE GULF OF ALASKA COASTAL PLAIN,
Alaska Univ., College. Dept. of Geology.
P. J. Cannon.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Year Ending March 1976, Vol 12. Geology, p 373-390, April 1976. 1 fig, 1 tab, 4 ref. 03-5-022-56.

Descriptors: *Alaska, *Geomorphology, *Coastal plains, *Water pollution, *Hazards, *Baseline studies, *Resources development, *Environmental effects, *Cold regions, Radar, Earthquakes, Mapping, Organic compounds.
Identifiers: *Outer Continental Shelf, Oil exploration, Oil development, *Gulf of Alaska, Radar imagery, *Environmental geology.

The purpose of the study was to produce information which can be used in an environmental assessment of the coastal plain section of the Gulf of Alaska, in relation to possible oil and gas development and to evaluate radar imagery as a major information source for environmental geological mapping. It was found that radar imagery is an adequate tool to use in the environmental evaluations of diverse types of coasts. X-band, real aperture radar imagery of the Gulf of Alaska coastal plain is adequate both as a mapping base and as a source of important environmental geologic data. The radar imagery of the Gulf of Alaska coastal plain indicates that severe environmental geologic hazards, such as earthquakes, surface movements along active faults, and outburst floods, have occurred recently and will continue to occur with a relatively high frequency. Natural processes are modifying parts of the coastal plain at a relatively rapid rate. (Sinha-OEIS)

DISTRIBUTION, COMPOSITION AND TRANSPORT OF SUSPENDED PARTICULATE MATTER IN THE GULF OF ALASKA AND SOUTHEASTERN BERING SHELF,
National Oceanic and Atmospheric Administration, Seattle, Wash. Pacific Marine Environmental Lab.
R. A. Feely, and J. D. Cline.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Year Ending March 1976, Vol 12, Geology, p 467-484, and 409-466 (pages placed in wrong order), April 1976. 30 fig, 2 tab, 30 ref.

Descriptors: *Alaska, *Sediment transport, *Resources development, *Baseline studies, *Environmental effects, *Water pollution, *Pollutants, Suspended solids, Sedimentation, Oil pollution, Organic compounds.
Identifiers: *Outer Continental Shelf, Oil exploration, Oil development, *Gulf of Alaska, *Bering Sea, Seasonal variations.

Particles suspended in seawater play a major ro
in regulating the chemical forms, distributions a
ultimate deposition of many marine pollutan
Some toxic substances in particulate form a
transported to the oceans where they are desorb
at the freshwater-seawater interface. Other su
stances (particularly petroleum hydrocarbons) a
adsorbed onto the surface of suspended particl
and are removed to the sediments as the particl
settle. The major objective of the particul
matter program in the Gulf of Alaska a
southeastern Bering Shelf is to determine t
seasonal variations in the distribution, compo
tion, and transport of suspended matter. Other o
jectives include: (1) the high frequency (hour
variability in the distribution of suspended matt
and (2) the investigation of the role of resusp
sion processes as a mechanism for redistributi
of sedimentary materials. Preliminary conclusio
indicate that surface suspended matter distri
tions of the southeastern Bering Shelf appear
follow the general pattern of circulation in Bris
Bay. Suspended material from the northern riv
is generally carried to the west and southwest
the counterclockwise currents. In the Gulf
Alaska the distribution of suspended matter at
surface appears to follow the general pattern
circulation in the Gulf of Alaska. Studies of
temporal variability of suspended matter near
bottom indicate that resuspension processes m
be occurring. (Sinha-OEIS)

drilling, Oil exploration, Oil developme
*Beaufort Sea, Seismic data, Sand and gra
resources, Engineering properties.

A knowledge of the distribution of deep ice-r
permafrost is fundamental to engineer
problems related to offshore drilling and
production and to the interpretation of seis
data for resource studies. Permafrost has a mar
influence on the engineering properties of so
and probably of marine sediments. Ice gouging
the sea floor commonly exposes semi-c
solidated sediments and creates metastable go
ridges. Thus, the engineering properties of surf
and subsurface shelf sediment need to be
sessed, so that potential hazard to offshore c
struction may be determined. Sand and gravel
essential construction materials for drill pads,
strips, roads and offshore islands. In the Prud
Bay area, materials are now obtained from
river channels and from the offshore islan
where the gravel has apparently been reconc
trated from the Gubik Formation. In the vicinity
Barrow the Gubik Formation has little gravel
this building material is in short supply. A
result, the potential for the offshore sand
gravel resources needs to be evaluated. (Sin
OEIS)

**MARINE ENVIRONMENTAL PROBLEMS
THE ICE COVERED BEAUFORT SEA SHE
AND COASTAL REGIONS,**
Geological Survey, Menlo Park, Calif.
P. Barnes, E. Reimnitz, and D. Drake
In: Environmental Assessment of the Alask
Continental Shelf. Principal Investigators' Repo
for the Year Ending March 1976, Vol 12. Geolo

12-590, April 1976. 10 fig, numerous tab, 14 ref. 6-6074.

scriptors: *Alaska, *Ice cover, *Cold regions, esources development, *Baseline studies, nvironmental effects, *Oil pollution, rmafrost, Coasts, Pipelines, Pollutants, Or-ic compounds.
ntifiers: *Outer Continental Shelf, Oil explora-, Oil development, Offshore drilling, Arctic ean, *Beaufort Sea.

e primary goal of the program has been to un-stand the processes that are unique to Arctic lves and their sedimentary environment, where ice plays an important role. Specific objectives e included: a definition of the character of bot-materials, including permafrost; a study of the sent sediment transport and depositional chanisms; and studies of the Holocene and istocene geologic record. The character of the ic continental shelf and coastal area, with its mafrost, faces the developer with many special blems. Any structure which is to be connected he ocean floor requires data concerning the ngth and character of the ocean floor. In addi-, the offshore drilling operation may encounter mafrost which would be substantially altered ing the process of pumping hot oil up to the sea or or along the sea floor in gathering and trans-tation pipelines. The interaction of the arctic lf with the arctic pack ice takes the form of ice ging and the formation of a large stamukhi e each winter. These factors are of utmost im-tance to the designers and operators of shore terminals and pipelines. (Sinha-OEIS)

7-03251

AVY-MINERAL TRENDS IN THE BEAU-RT SEA,
ological Survey, Menlo Park, Calif.
Luepke.
Environmental Assessment of the Alaskan ntinental Shelf. Principal Investigators' Reports the Year Ending March 1976, Vol 12. Geology, 41-676, April 1976. 6 fig, 6 tab, 45 ref. Also as S.G.S Open-file Rept 75-667.

Descriptors: *Alaska, *Resources development, *Baseline studies, *Sediment transport, Sediments, *Heavy metals, Geology, *Mineralogy, Path of pollutants.
Identifiers: *Outer Continental Shelf, *Beaufort Sea, North Slope, Pack ice, *Heavy minerals.

Sediments of the Beaufort Sea, off the North Slope of Alaska contain a great variety of heavy minerals. These include garnet, chrome spinel, augite, pigionite, diopside, hornblende, enstatite, hypersthene, epidote, clinozoisite, zoisite, apatite, tourmaline, chlorit oid, sphene, zircon, and opaque minerals. Much rarer constituents are glaucophane, lamprob lite, rutile, Kyanite, staurolite, and riebeckite. Garnet increases in abundance from east to west which corresponds to a similar increase in garnet abundance in coastal outcrops of the Gubik Formation sands. Only garnet and iron-stained aggregates appear to have source-related distribution patterns. The other heavy minerals lack distinct distributive provinces, reflecting an environment dominated by intense mixing by ice-gouging and bioturbation and a homogenous source area. Waves and currents are not strong enough to sort sediments at depths greater than 10 m except during summer storms. The source of the Beaufort Sea heavy minerals is dominated by contributions from the Alaskan North Slope deposits of Tertiary and younger age. The Colville River, largest in the region, is probably the most influential in transporting sediments, but because of wave and current-mixing of sediments on the shelf, exact contributions from each river drainage cannot be ascertained. Coastal erosion of the Gubik Formation is probably at least as important as the Colville River in supplying heavy minerals to the Beaufort Sea. (Sinha-OEIS)
W77-03254

YUKON DELTA COASTAL PROCESSES STUDY,
Wesleyan Univ., Middletown, Conn. Dept. of Earth and Environmental Sciences.
W. R. Dupre, and D. M. Hopkins.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Year Ending March 1976, Vol 13. Geology, p 5-40, April 1976. 10 fig.

Descriptors: *Alaska, *Oil spills, *Oil pollution, *Offshore platforms, Water pollution, *Baseline studies, Environmental effects, *Resources development, Hazards, *Deltas, Estuaries, Pipelines, Storms, Permafrost, Organic compounds.
Identifiers: *Outer Continental Shelf, *Oil exploration, *Oil development, *Coastal processes, *Offshore drilling, Bering Sea, Yukon River, Shorefast ice, Drilling platforms, Coastal stability.

Much of the Yukon delta is underlain by the onland extension of the Nunivak Arch; this would seem to exclude most of the region for serious consideration for exploration. Nevertheless, the Quaternary faults and volcanoes which characterize the zone constitute serious geologic constraints on the selection of transportation corridors. The discontinuous permafrost and the complex hydrology of the delta further complicate the location of such corridors, as well as making it difficult to predict the effects of oil spills. The selection of shoreline sites (e.g. docking and pipeline terminals) must take into account the present coastal stability, including the possibility of erosion associated with major storm surges, even in an area of long-term progradation. In addition, the effects of shorefast ice for over half of the year must be considered. The siting of offshore facilities (e.g., drilling platforms, underwater pipelines) must take into account the extent and variability of shorefast ice, the possibility (as yet unproven) of offshore permafrost, and the possible effects of altering offshore bathymetry in changing coastal stability. In addition, the effects of possible oil spills must take into account not only the dominant northward drift of water and sediments, but also the local and seasonal variability of current patterns. (Sinha-OEIS)
W77-03255

FAULT HISTORY OF THE PRIBILOF ISLAND AND ITS RELEVANCE TO BOTTOM STABILITY IN THE ST. GEORGE BASIN,
Geological Survey, Menlo Park, Calif.
D. M. Hopkins.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Year Ending March 1976, Vol 13. Geology, p 41-67, April 1976. 7 fig, 12 ref.

Descriptors: *Alaska, *Pipelines, *Hazards, *Earthquakes, *Faults(Geologic), *Oil spills, *Oil pollution, *Baseline studies, *Resources development, Environmental effects, Water pollution.
Identifiers: *Outer Continental Shelf, Oil exploration, Oil development, *Pribilof Sound, Bottom stability, *St. George Basin, Fault history.

This study evaluates frequency of faulting and volcanic eruptions on the Pribilof Islands and in nearby waters, examines rates and directions of changes in the island shorelines during the 20th Century, and investigates the nature of the soils and their susceptibility to erosion after disturbance. Volcanos have been active in the Pribilof Island area throughout the last 8 m.y., activity during the last 300,000 years has been confined to the vicinity of St. Paul Island. Eruptions recur at intervals of about 10,000 years. Faulting is also an ongoing process. Fault movements recur at rather long but still unknown intervals. Although the recurrence interval of movement on individual faults is long, the fault hazard is significant, because faults cross any possible path for a pipeline connecting production areas in the St. George Basin with terminal facilities on the Pribilof Islands. The sandy beaches and sandy soils of St. Paul Island are sensitive to human activity. Perturbations related to construction of logistic bases and pipeline and transhipment facilities are likely to result in extensive changes in the beaches and loss of surface soils by wind deflation. (Sinha-OEIS)
W77-03256

EARTHQUAKE ACTIVITY AND GROUND SHAKING IN AND ALONG THE EASTERN GULF OF ALASKA,
Geological Survey, Menlo Park, Calif. Office of Earthquake Studies.
J. C. Lahr, and R. A. Page.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Year Ending March 1976, Vol 13. Geology, p 69-90, April 1976. 11 fig, 10 ref.

Descriptors: *Alaska, *Hazards, *Seismic studies, *Earthquakes, *Faults(Geologic), *Coastal structures, *Oil spills, *Oil pollution, *Baseline studies, *Resources development, Environmental effects, Water pollution, Leases, Organic compounds.
Identifiers: *Outer Continental Shelf, Oil exploration, Oil development, *Gulf of Alaska, Fault history, Offshore structures.

Work completed at this time indicates that the seismic hazard is extreme in the eastern Gulf of Alaska. Continued seismic monitoring will no doubt reveal other areas of activity and delineate other active geologic structures. It is crucial that the potential seismic hazards in the eastern Gulf of Alaska be carefully analyzed and that the results be incorporated into the plans for future petroleum development. This information should be considered in the selection of tracts for lease sales, in choosing the localities for landbased operations, and in setting minimum design specifications for both coastal and offshore structures. The continental shelf of the eastern Gulf of Alaska is in a dynamic environment. Rivers and streams carry vast quantities of glacial silt and clay to this shelf, which is affected by strong longshore currents, frequent high energy storm waves, and occasional seismic sea waves (tsunamis). If this area is to be considered safe for petroleum production, the sediments found here must be carefully studied and all characteristics thoroughly understood. The movement of sediment is a vital consideration in any decision as to where to place artificial structures, such as those used by the petroleum industry, to ensure maximum safety. (Sinha-OEIS)

FAULTING AND INSTABILITY OF SHELF SEDIMENTS: EASTERN GULF OF ALASKA,
Geological Survey, Menlo Park, Calif.
P. R. Carlson, and B. F. Molnia.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Year Ending March 1976, Vol 13. Geology, p 107-124, April 1976. 7 fig.

Descriptors: *Alaska, *Hazards, *Environmental effects, *Baseline studies, *Resources development, Water pollution, Sediments, Faults(Geologic), Organic compounds.
Identifiers: *Outer Continental Shelf, Oil exploration, Oil development, *Gulf of Alaska, Slumps, Submarine slides.

Faults and submarine slides or slumps are potential environmental hazards on the outer continental shelf of the northern Gulf of Alaska. Submarine slides or slumps have found in two places in the OCS region: (1) seaward of the Malaspina Glacier and Icy Bay, an area of 1,770 square kilometers, that has a slope of less than one-half degree, and (2) across the entire span of the Copper River prodelta, an area of 1,730 square kilometers, that has a slope of about one-half degree. Seismic profiles across these areas show disrupted reflectors and irregular topography commonly associated with submarine slides or slumps. Other potential slide or slum areas have been delineated in areas of thick sediment accumulation and relatively steep slopes. These areas include Kayak Trough, parts of Hinchinbrook Entrance and Sea Valley, parts of the outer shelf and upper slope between Kayak Island and Yakutat Bay and Bering Trough. (Sinha-OEIS)

SEISMIC AND VOLCANIC RISK STUDIES - WESTERN GULF OF ALASKA,
Alaska Univ., College. Geophysical Inst.
H. Pulpan, and J. Kienle.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Year Ending March 1976, Vol 13. Geology, p 125-137, April 1976. 1 fig, 1 tab. 03-5-022-55.

Descriptors: *Alaska, *Volcanoes, *Seismic studies, *Tsunamis, *Oil pollution, *Water pollution, *Baseline studies, *Resources development, *Environmental effects, Hazards, Organic compounds.
Identifiers: *Outer Continental Shelf, Oil exploration, Oil development, *Gulf of Alaska, Offshore structures.

The purpose of the study was to assess seismic and volcanic risk in the western Gulf of Alaska, primarily from seismic data. Eight new seismic stations were installed in the study area to provide a higher resolution than previously existed. Data analysis of existing seismic data and the new seismic network is in progress. Several major eruptions occurred on Augustine Island during the report period and seismic data from before and during the eruption are being analyzed. Consequences of seismic and volcanic activity such as severe ground displacements, tsunami run-ups will put severe strains of offshore and onshore structures, erected in connection with pertroleum development. Ash falls, volcanic heat and pressure waves, mudflows and fast moving glowing clouds near active volcanoes will endanger equipment and crews. This study will provide pertinent input parameters toward deciding where to put these structures and what design criteria to use. (Sinha-OEIS)

FAULTING AND INSTABILITY OF SHELF SEDIMENTS - WESTERN GULF OF ALASKA,
Geological Survey, Menlo Park, Calif.
M. A. Hampton, and A. H. Bouma.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Year Ending March 1976, Vol 13. Geology, p 307-339, April 1976. 8 fig, 1 tab, 22 ref.

Descriptors: *Alaska, *Sediments, *Water pollution, *Baseline studies, *Resources development, *Environmental effects, *Hazards, *Oil pollution, Faults(Geologic), Pollutants.
Identifiers: *Outer Continental Shelf, Petroleum resources, Oil exploration, Oil development, *Gulf of Alaska, Kodiak Island.

Surface faulting has been identified in a zone along and offshore of the southeast coast of Kodiak Island, extending northeast to Montague Island. Scattered surface faults also exist on Albatross Bank, near the edge of the continental shelf. Movement along the surface faults could affect OCS resource activities near them. No major zones of slumping have been discovered so far, although some might exist on the sloping sides of major sea valleys where quantites of fine-grained sediment are accumulating. The major sea valleys appear to be likely dispersal routes for contaminated sediments, and some local storage of these sediments also is possible in the valleys. Attention is being directed mainly to the proposed area of federal OCS oil and natural gas lease sale no. 46. The results of this study can be used to identify areas where geologica conditions adverse to resource development exist and to determine the regional dispersal patterns and storage sites of contaminants introduced into marine sediments. ptors: *Beach erosion, *Sedimentation, ts, *Atlantic Ocean, *Lake Erie, Dunes, spits, Storms, Waves(Water), Oceans, Sands, Sediments, Beaches, Shores, Barrinds, Sedimentology.
iers: *Washover deposits, *Outer (NC), *Presque Isle(Pa), Barrier morphoitoral processes.

y formed small-scale washover deposits examined along a section of the Atlantic (Outer Banks, North Carolina) and Lake Presque Isle Peninsula, Pennsylvania) to ine their stratigraphic properties, mode of ent, and relationship to adjacent barrier morphology. Storm washover occurrence is ction of the degree of storm surge and ore-foredune relief. The shape and dimenthe resulting washover sand body is largely lled by surrounding topography. Overall l distribution, modality and skewness of nt samples from the adjacent washover, foredune, and beach show a strong similarity. Modality is related to texture subpopulation, while skewness reflects subpopulation mixing. Normal and inverse grading as well as textural coarsening in the presumed direction of washover flow are distinctive trends. Storm washover results from the deposition of sediment carried in a succession of unidirectional, discontinuous surges which flow past the berm, or foredune line, and downslope across the washover surface. Flow velocities imparted by the initial fluid surge coupled with downslope gravity effects facilitate the development of flow similar to sediment gravity flow. In some cases, added shear stress imposed on a sediment-concentrated bed layer by the overlying fluid results in the development of grain flow, a type of sediment gravity flow. Washover contributes to landward and vertical accretion of relatively coarse detritus in the barrier environment, thus serving as temporary sediment sink in an erosional (transgressive) littoral drift system. Descriptors: *Estuaries, *Rivers, *Water circulation, *North Carolina, Circulation, Flow, River flow, Winds, Temperature, Water temperature, Tides, Tidal effects, Tidal waters, Coasts, Currents(Water), On-site investigations, Sampling, Computer programs, Data processing.
Identifiers: *Neuse River(NC), *Pamlico Sound(NC).

A 38-day definitive study of the Neuse River circulation was undertaken from 7 August to 14 September 1973. From this study the following conclusions can be made: (1) The net circulation in the river is slow and complicated (circular flow patterns across river and return flow upstream). A rough estimate of the mean net flow for the river is 1.81 cm/sec, and the corresponding transit time for water starting near New Bern and entering Pamlico Sound is 32 days. Because of the complicated crossstream, upstream flow, waste materials could remain in a local area for a time considerably longer than that predicted by the rough transit time included above. (2) Lunar tides may be the driving mechanisms for the observed circulation at all stations upstream from Pamlico Sound. All the upstream stations have a near tidal period in the upstream, downstream current fluctuations. Only one of two stations at the mouth of the river does not have a significant semi-diurnal component in its flow. (3) The winds usually tend to enhance the river circulation. They are generally diurnal (land breeze in morning, sea breeze in afternoon) and seem to have the largest effect on flow at the station located at the river mouth, but these effects may be indirect; i.e., they may be due to Pamlico Sound circulation which is generally understood to be wind-driven. Available from the National Technical Information Service, Springfield, VA 22161 as PB-251 123, Price codes: A04 in paper copy, A01 in microfiche. NOAA Technical Report NWS 18, November 1975. 49 p, 23 fig, 2 tab, 12 ref.

Descriptors: *Tides, *Storms, *Floods, *Gulf of Mexico, *Florida, Historic floods, Tidal waters, Model studies, Bays, Estuaries, Storm surge, Flood frequency, Frequency analysis, Frequency curves, Hurricanes, Coasts, Barrier islands, Winds, Wind tides, Analytical techniques.
Identifiers: *Storm tides, *Apalachicola Bay(Fla), *St. George Sound(Fla), Tide frequencies, Coastal flooding, Joint probability method.

Storm tide height frequency distributions were developed within Apalachicola Bay and St. George Sound, Florida, for the National Flood Insurance Program. This was accomplished by applying Overland's numerical bay model to a full set of climatologically representative hurricanes. Surge computations by the continental shelf SPLASH model were used as the boundary input from the Gulf of Mexico. Tide levels were shown in map form and as frequency distributions at selected points between annual frequencies of 0.10 and 0.002. The report illustrated the application of a joint probability method to assessing storm tides within a bay using a hydrodynamic model. (Sims-ISWS)

Journal of the Waterways, Harbors and Coastal Engineering Division, American Society of Civil Engineers, Vol. 102, No. WW4, Proceedings Paper 12550, p 425-442, November 1976. 15 fig, 25 ref, 3 append. N00014-68-A-0308-0002.

Descriptors: *Salinity, *Estuaries, *Model studies, *Density, *Computer models, *Circulation, Physical properties, Density currents, Stratification, Estuarine environment, Gulfs, Oceanography, Chemical properties, Vortices, Mathematical models, Water circulation, Density stratification, Numerical analysis, Water properties.
Identifiers: *Estuarine circulation, *Salinity gradients, Finite differences, Horizontal salinity gradients, Density gradient.

A finite difference approximation to the equations of motion without the field acceleration terms and the salt conservation equation with an isotropic diffusion coefficient were used to model the circulation of a rectangular basin having the gross dimensional characteristics of a bar-built estuary. The recursion relations include the dynamic effects of horizontal salinity variations. Two cases were examined. In the first case, the basin has a constant depth; and in the second case, the bottom slope varies linearly across the basin. The resulting patterns of circulation were qualitatively analyzed using a vorticity equation. The analysis indicated that the dynamic effects of horizontal salinity gradients can be significant in controlling the circulation in localized sections of the basin. (Henley-ISWS)

SEASONAL VARIATION OF RESIDUAL DRIFT IN LONG ISLAND SOUND,
Connecticut Univ., Groton. Marine Sciences Inst.
D. F. Paskausky, and D. L. Murphy.
Estuarine and Coastal Marine Science, Vol. 4, No. 5, p 513-522, September 1976. 10 fig, 2 tab, 13 ref.

Descriptors: *Estuaries, *Sounds, *Drifting(Aquatic), *Onrsite investigations, Winds, Currents(Water), On-site data collections, Circulation, Seasonal, Upwelling, Water circulation, Movement, Coasts, Connecticut.
Identifiers: *Long Island Sound.

Residual drift in Long Island Sound (LIS) was analyzed based on the recovery of 346 out of 951 surface and bottom drifters released at 86 locations in 1973 and 1974. Two periods of distinctly differing drift correlated with wind and freshwater discharge variation. The summer period (June to early November 1973) was characterized by relatively weak southwest winds and low freshwater discharge. In the winter period (after early November 1973), there were strong northwest winds and relatively high freshwater discharge. An estuarine circulation (surface outflow and bottom inflow) exists in eastern LIS throughout the year. Bot..m drifter returns received in the summer period indicated that the westward flux of near bottom waters does not extend into central LIS past Mattituck Sill. During the winter season, near bottom waters move well into central LIS, and upwelling against the Connecticut coast is apparent. There was little evidence for significant near bottom exchange between western and central LIS. (Humphreys-ISWS)

SEDIMENT MASS BALANCE OF A LARGE ESTUARY, LONG ISLAND SOUND,
Yale Univ., New Haven, Conn. Dept. of Geology and Geophysics.
H. J. Bokuniewicz, J. Gebert, and R. B. Gordon.
Estuarine and Coastal Marine Science, Vol. 4, No. 5, p 523-536, September 1976. 8 fig, 1 tab, 29 ref, 1 plate.

Descriptors: *Estuaries, *Sounds, *Sediments, *Surveys, On-site investigations, Topography, Sounding, Measurement, Sediment distribution, Erosion, Geomorphology, Sands, Glacial drift.
Identifiers: *Long Island Sound.

Acoustic reflection profiles and bottom sampling were used to measure the volume of sediments accumulated in Long Island Sound. There is present 10 to the 10th power cu m of sediment of which 5.3 X 10 to the 9th power cu m is marine mud and 4.9 X 10 to the 8th power cu m is probably of premarine, lacustrine origin. The balance consists of reworked sand derived from glacial drift. The acoustically determined subbottom structure of the Sound and available sea level data indicate that the Sound basin was occupied by a large lake for at least 6,000 years and has been an arm of the sea since 8,000 years b.p. The volume of lacustrine sediment was accounted for by direct riverine input over 6,000 years, but the volume of marine mud present substantially exceeds the riverine supply over 8,000 years. The Sound was shown to act as a trap for sediments originating on the continental shelf. (Humphreys-ISWS)

RELATIONSHIPS BETWEEN SAND INPUT FROM RIVERS AND THE COMPOSITION OF SANDS FROM THE BEACHES OF SOUTHERN CALIFORNIA,
University of Southern California, Los Angeles. Dept. of Geological Sciences.
R. M. Rice, D. S. Gorsline, and R. H. Osborne.
Sedimentology, Vol. 23, No. 5, p 689-703, October 1976. 3 fig, 4 tab, 41 ref.

Descriptors: *Sands, *Beaches, *California, Rivers, Heavy metals, Coasts, Sediment transport, Streams, Sedimentation, Geology.
Identifiers: *Heavy mineral distribution, *Santa Clara River(Calif), Coastal zones, Principal component analysis, Discriminant function analysis.

During the period from 1967 through 1972, a sampling program was completed to determine the economic potential of heavy metals in the beach and river sands of the southern California coastal zone. These samples were employed to test the hypothesis that sand composition in a given beach cell is dominantly controlled by the provenance draining into that cell and is not strongly influenced by longshore leakage from upcurrent cells. Sample sets obtained before and after the exceptional flood of 1969 made it possible to compare the sediment supplied by normal river flow with that supplied by a major flood. Multivariate statistical analysis of the heavy mineral distribution of southern California beaches and rivers indicated that the sand composition of the two northern cells is controlled by the dominantly sedimentary Transverse Range provenance, whereas the composition of the three southern cells is controlled by the dioritic Peninsular Ranges. Some leakage occurs between the two northern cells around the Point Dume-Hueneme-Mugu Canyon Zone, whereas no important southward mixing occurs between cells around the Palos Verdes-Redondo Canyon Zone. Even though the Santa Clara River flows mostly through sedimentary terrains, samples from this river strongly reflect the granodioritic source present in its headlands. Although the basic sand composition within each cell persists during major flooding, leakage between cells may increase following flooding, and the compositional packages present may show evidence of greater mixing. (Lee-ISWS)

A CINE-CAMERA TECHNIQUE FOR PROCESS MEASUREMENT ON A RIDGE AND RUNNEL BEACH,
Reading Univ. (England). Dept. of Geology; and Reading Univ. (England). Sedimentology Research Lab.
P. Wright.
Sedimentology, Vol. 23, No. 5, p 705-712, October 1976. 3 fig, 12 ref.

Descriptors: *Beaches, *Beach erosion, Coasts, Rocks, Hydrology, Sea water, Ripple marks, Geology, Waves(Water), Photography, *Measurement.
Identifiers: *Bed forms, Rock records, Swash-backwash action, Cine-camera technique, Sea ridge, Runnel beach, Photographic method.

Previous attempts to quantify beach processes with techniques involving direct measurement have met with varying degrees of success. Problems encountered can be attributed to three main areas of difficulty: (1) the rapidity of change in both process operation and the subsequent production and development of bed forms; (2) the inclement nature of the weather conditions during which the most rapid beach changes take place; and (3) interference by the equipment with the flows being measured. A photographic method was described here which, to a great extent, overcor es these problems and can be operated ch ply by a solitary field investigator. (Lee-ISW)
W77-03325

LARGE SAND WAVES ON THE ATLANTIC OUTER CONTINENTAL SHELF AROUND WILMINGTON CANYON, OFF EASTERN UNITED STATES,
Geological Survey, Boston, Mass.
H. J. Knebel, and D. W. Folger.
Marine Geology, Vol 22, No 1, p M7-M15, September 1976. 3 fig, 25 ref.

Descriptors: *Sediment transport, *Sands, *Atlantic Ocean, *Continental Shelf, *Sand waves, Data collections, Ocean currents, Storms, Analytical techniques, Seismic studies.
Identifiers: *Wilmington Canyon, *Outer Continental Shelf.

New seismic-reflection data show that large sand waves near the head of Wilmington Canyon on the Atlantic Outer Continental Shelf have a spacing 100-650 m and a relief of 2-9 m. The bedfor trend northwest and are asymmetrical, the steep slopes being toward the south or west. Vibrac sediments indicate that the waves apparently ha formed on a substrate of relict nearshore se ments. Although the age of the original bedfor is unknown, the asymmetry is consistent with dominant westerly to southerly drift in this a which has been determined by other methods; asymmetry, therefore, is probably modern. Obs vations in the sand-wave area during August 19 revealed weak bottom currents, sediment biot bation, unrippled microtopography, and lack scour. Thus, the asymmetry may be maintained periodic water motion, possibly associated w storms or perhaps with flow in the canyon he (Woodard-USGS)

Descriptors: *Estuaries, *Copepods, *F habits, *Biomass, Biorhythms, Particle s *Chesapeake Bay, Zooplankton, Digest Crustaceans, Plankton, Seasonal, Instrume tion, Herbivores, Primary productivity, Maryla Identifiers: Eurytemora affinis, Acartia to Acartia clausi, Automated particle coun systems, *Patuxent River(Md).

Studies with an automated particle coun system of the feeding activities of Chesape Bay and Patuxent River copepods show t while adult Eurytemora affinis can ingest parti ranging in size from 3 to 24 millimicrons sphe equivalent diameter, their filtering rate is hig when ingesting particle sizes which correspon the mode of the particle biomass distribution. cordingly, the copepods vary their maximum tering rate in accordance with changes in tim the biomass peaks. The copepods Acartia to and Acartia clausi have similar feeding habits; in contrast to Eurytemora affinis, they prefer tively large particles of 20 millimicrons regard of biomass distribution. Concomitant testing comparisons with earlier research, primarily Eurytemora affinis, indicate that juve copepods in the nauplius stages feed rather selectiely over a broad range of particle sizes, a tendency toward higher filtering rates for la particles when such particles are fairly comm Moreover, maximum feeding efficiency at or concentration peaks appears to establish itse the early copepodite state and possibly even late nauplius stage. Laboratory pilot experim also show that the filtering rate of Eurytemor finis shows a threshold response with prey se tion switching from the small to the large parti (Harris-Wisconsin)

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

3A. Saline Water Conversion

ONE PASS SEAWATER DESALTING RO PILOT PLANT EVALUATION,
Du Pont de Nemours (E. I.) and Co., Wilmington, Del.
P. P. Goodwyn.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-262 207, Price codes: A06 in paper copy, A01 in microfiche. OWRT/S--77/1, Final Report, June 1976. 95 p, 15 tab, 7 fig, 13 ref. OWRT 14-34-0001-6507.

Descriptors: Desalination, *Desalination processes, *Membrane processes, *Reverse osmosis, Sea water, *Pilot plants, Estimated costs, Pre-treatment(Water).
Identifiers: Polyamide hollow fiber permeators, Dechlorination, Fouling control, Cost estimates, Wrightsville Beach(NC).

Results obtained with three different modes of biological fouling control for reverse osmosis seawater systems, as tested at the OWRT Wrightsville Beach Test Facility (WBTF), are discussed. Modes tested were (1) chlorination followed by carbon dechlorination; (2) chemical dechlorination with sodium bisulfite instead of carbon; (3) ultraviolet (UV) irradiation instead of chlorination/dechlorination. Polyamide hollow fiber reverse osmosis permeators operating at 800 psi and desalting seawater in a single stage were used in these tests. Collectively, the RO test systems produced about 15,000 gpd of potable water. Either UV or chlorine treatment with bisulfite dechlorination was as effective as chlorination with carbon treatment in maintaining stable performance in this test. Earlier cost analyses were revised to reflect more realistic bases. Carbon treatment was substantially more expensive than either of the other options. Demonstrated service life for 4-inch and 8-inch diameter polyamide hollow fiber RO permeators was extended to more than 6000 and 4000 hours, respectively. Operating experience, recommended pretreatment procedure and suggested further studies are discussed. (OWRT)

STUDIES ON A MECHANISM FOR SALT REJECTION IN REVERSE OSMOSIS MEMBRANES AS A GUIDE TO IMPROVED MATERIALS FOR DESALINATION OF SEA WATER.
Pittsburgh Univ., Pa.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-262 410, Price codes: A05 in paper copy, A01 in microfiche. OWRT/S--77/2, Final Report, 1976, 74 p. OWRT 14-30-3241.

Descriptors: *Desalination processes, Sea water, *Reverse osmosis, *Membranes, *Membrane processes, Matherials, *Ion transport, *Anion exchange, Aqueous solution, Chemical analysis, *Spectroscopy, Ion exchange, Hydration.
Identifiers: *Cellulose acetate membranes, Nonaqueous media, Electron spectroscopy, Flame emission spectroscopy, Phosphorylated cellulose acetate membranes.

This report is presented in two parts which describe studies of the interactions of ions with water in nonaqueous systems in general and in reverse osmosis membranes in particular. The first part describes studies of cellulose acetate membranes which have been treated with aqueous salt solutions. The membranes were studied by ESCA (Electron Spectroscopy for Chemical Analysis) and by Flame Emission Spectroscopy. It is shown that sodium ions penetrate and are retained in the membranes, even after rinsing and that their interaction appears to be particularly strong in the active side of the asymmetrical membranes. An attempt was also made to prepare an effective phosphorylated cellulose acetate membrane which should show superior resistance to hydrolysis at high pH. This phase of the project was not completed, but a recent Japanese patent shows that such membranes may be operable. Further development of such membranes is recommended. The second part of the report describes studies of the hydration of anions in non-polar non-hydrolysis solvents. The resulting free energies of hydration are related to a large number of other water - ion interactions. It is suggested that ion separation by membranes can be profitably regarded in terms of the energy required for dehydration rather than as the consequence of some kind of ion-rejection by the membrane.

3B. Water Yield Improvement

PLASTIC-REINFORCED ASPHALT SEEPAGE BARRIER,
Arizona Water Resources Research Center, Tucson.
R. K. Frobel, and C. B. Cluff.
Paper Reprint, Journal of the Irrigation and Drainage Division, ASCE, Vol. 102, No. IR3, Proc. Paper 12430, September, 1976. p. 369-380. 8 fig, 1 tab, 8 ref. OWRT A-059-ARIZ(3). 14-31-0001-5003.

Descriptors: Adhesion, *Asphalts, Linings, Membranes, *Plastics, *Reinforcement, *Seepage, Water resources, *Barriers, Equipment, Testing.
Identifiers: *Puncture resistance.

This report is concerned with laboratory equipment development, laboratory testing, and field investigations of a water seepage barrier consisting of plastic-reinforced asphalt. Three testing methods were utilized and evaluated in the asphalt-plastic-asphalt-chip-coated (APAC) membrane investigation. The first test method evaluated the hydrostatic puncture resistance of an asphalt-polyethylene combination. This test confirmed the hypothesis that the asphalt effectively increases the puncture resistance of the APAC membrane over that of plain polyethylene. The second test investigated the slope stability of a protective APAC chip seal. It was found that a typical 3/8-in. (9.5-mm) cover aggregate remained stable on constructed slopes of 3:1 and 4:1 and also remained stable on a 2:1 slope up to a surface temperature of 122F (50C). The third test method evaluated adhesive materials and determined the best suited adhesive for sealing polyethylene overlaps. Subsequent field investigations resulted in equipment development that increased construction efficiency in the installation of the APAC membrane.

WEATHER MODIFICATION DESIGN STUDY FOR STREAMFLOW AUGMENTATION IN THE NORTHERN SIERRA NEVADA, EXECUTIVE SUMMARY,
M and B Associates, San Ramon, Calif.
C. C. Lovell, A. K. Goroch, and K. W. Chu.
Report MB-R-76/75A, July 1975. 38 p, 2 fig, 116 ref. Prepared for Bureau of Reclamation, Denver, Colorado, Engineering Research Center. Bur Reclam 14-06-D-7659.

Descriptors: *Storms, Snowfall, Snowpacks, Climatology, Precipitation(Atmospheric), *Cloud seeding, Hydrology, *Weather modification, Experimental design, *Cloud physics, Streamflow.
Identifiers: *Sierra Nevada region, *Winter storms, *Mesoscale, Climatology.

Results are presented of a design study for a pilot program to augment snowpack in the Sierra Nevada. The background for the program includes a review of the synoptic and mesoscale climatology and the cloud physics of winter storms in the area. The climatology and cloud physics relationships to precipitation occurrence, rate, and duration within the river basins under consideration are established. A hydrology model was used to estimate the run-off enhancement potential as a function of the type of precipitation and target areas. The result of these simulations is followed by a review of the state of cloud model development and of possible uses of models in a pilot program. Finally, the seeding potential of Sierra Nevada storms is explored. This background information is synthesized to form a physical model of precipitation mechanisms in the Sierra Nevada. The model establishes a set of hypotheses which, in turn, form the basis of the experimental design for the pilot program. The operational requirements are presented in another volume. (See W77-03213 thru W77-03215) (Bur Reclam)
W77-03212

WEATHER MODIFICATION DESIGN STUDY FOR STREAMFLOW AUGMENTATION IN THE NORTHERN SIERRA NEVADA, VOLUME I - METEOROLOGY AND HYDROLOGY OF THE NORTHERN SIERRA NEVADA, FINAL REPORT.
M and B Associates, San Ramon, Calif.
Report MB-R-76/75A, July 1976. 161 p, 25 fig, 3 tab, 116 ref, 2 append. Prepared for Bureau of Reclamation, Denver, Colorado, Engineering and Research Center. BuRec 14-06-D-7659.

Descriptors: *Weather modification, *Meteorology, Hydrology, Reviews, *Cloud physics, *Model studies, *Climatology, Nucleation, Synoptic analysis, *Storms, Snowfall, River basins, Streamflow, Runoff, Simulation analysis, Precipitation(Atmospheric), Data collections, Data processing.
Identifiers: *Sierra Nevada region, Meso-scale climatology, Winter storms.

This first volume presents a review of the setting for the program, including the meteorology and hydrology of the Central and Northern Sierra Nevada, a review of the state of knowledge of the cloud physics, and associated models with possible applicability to the region. The first part of this volume is intended to provide a complete background for the design. It begins with a review of the synoptic and meso-scale climatology of the Sierra Nevada, followed by a similar review of the state of knowledge of the cloud physics of winter storms in this region. The result of a statistical study of snowfall relationships within the river basins under consideration is presented. Precipitation rates and duration as a function of elevation are related to the climatology and cloud physics peculiar to Sierra Nevada winter storms. The results of the hydrology portion of the study are presented with an emphasis on the run-off enhancement potential as a function of the type of precipitation and target area. Then a review of the possible uses of simulation models in a pilot program and the state of model development available for these applications is discussed. (See also W77-03212) (Bureau of Reclamation)

WEATHER MODIFICATION DESIGN STUDY FOR STREAMFLOW AUGMENTATION IN THE NORTHERN SIERRA NEVADA, VOLUME II - PHYSICAL AND STATISTICAL DESIGN, FINAL REPORT.
M and B Associates, San Ramon, Calif.
Report MB-R-76/75A, July 1976. 73 p, 1 fig, 6 tab, 116 ref. Prepared for: Bureau of Reclamation, Denver, Colorado, Engineering and Research Center. BuRec 14-06-D-7659.

Descriptors: *Weather modification, *Meteorology, Hydrology, Reviews, *Cloud physics, *Model studies, *Climatology, Nucleation, Synoptic analysis, *Storms, Snowfall, River basins, Streamflow, Runoff, Simulation analysis, Precipitation(Atmospheric), Data collections, Data processing.
Identifiers: *Sierra Nevada region, Meso-scale climatology, Winter storms.

This second volume presents a physical model for snow augmentation based on the background and analysis presented in Volume I. (See W77-03213) This model of seedable alternatives for the Sierra Nevada provides the basis for a series of physical hypotheses for snowfall enhancement. These hypotheses are structured in such a way as to provide the basis for an experimental design for the assessment of the augmentation potential in Sierra Nevada winter storms. The statistical design for the experiment has been developed and is also presented in this volume. The design is structured against the hypotheses developed in the first sections of this volume and is based on the statistics of the precipitation in the Sierra Nevada presented in Volume I. (See also W77-03212.) (Bureau of Reclamation)
W77-03214

WEATHER MODIFICATION DESIGN STUDY FOR STREAMFLOW AUGMENTATION IN THE NORTHERN SIERRA NEVADA, VOLUME III - OPERATIONAL DESIGN, FINAL REPORT.
M and B Associates, San Ramon, Calif.
Report MB-R-76/75A, July 1976. 83 p, 12 fig, 5 tab, 116 ref. Prepared for: Bureau of Reclamation, Denver, Colorado, Engineering and Research Center. BuRec 14-06-D-7659.

Descriptors: *Weather modification, *Cloud seeding, Storms, *Snowpacks, *Design criteria, Design data, Design storm, *Optimization, Streamflow, Forecasting, Meteorology, Precipitation(Atmospheric), Costs, Operations.
Identifiers: *Snow augmentation, *American River drainage basin, *Sierra Nevada region.

This third volume discusses the specific recommendations for the operational design of the snow augmentation project in the Sierra Nevada. Volumes I and II (See W77-03213 and W77-03214) contain the background information and scientific analyses which provided the rationale for making the specific recommendations contained in this volume. Recommended forecasting procedures, daily operating procedures, and evaluation procedures are contained in the first three sections. The fourth section discusses various hardware systems. Several programs in the Sierra Nevada have shown that weather modification is technically feasible. The primary goals of the project are further development of the technology of when and how to optimally seed the storms and to evaluate the effectiveness of cloud seeding for the augmentation of snowpack. The optimum snow augmentation technique for conditions peculiar to the Sierra Nevada was identified and a plan for implmenting the technique was developed. [illegible] statistical design was formulated which wo[illegible] most efficiently measure the effectiveness of [illegible] snow augmentation technique. Major aspects [illegible] the recommended design are: a randomized [illegible] periment involving the entire target area; util[illegible] tion of both forecasts and real time data for [illegible] declaration of experimental days; a basic exp[illegible] mental unit of a 24-hour period; and seeding c[illegible] ducted by both ground-based generators and [illegible] borne generators. KEEP COOL WITH SEWAGE EFFLUENT - A TWO-WAY SAVING OF WATER,
R. Wood.
Process Engineering, p 71, June, 1976. 1 fig.

Descriptors: *Water reuse, *Sewage effluents, *Nitrification, *Cost analysis, *Cooling water, *Power plants, Recycling, Cleaning, Activated sludge.

A procedure using sewage effluent as cooling water in power plants was discussed. Croydon Power Station, built on top of a sewage works in Britain, was the example used. Treated effluent with borehole water for makeup has been successful. No metallic corrosion problems appeared and there was no need for manual cleaning of condensers or acid washing. The natural draught cooling towers acted as nitrifiers and the pond acted as an activated sludge system; thus, effluent quality was improved. The towers also maintained necessary nitrification during the winter. It was concluded that sewage effluent may be used in other applications to provide water savings. (Collins-FIRL)

Identifiers: *Sunflower.

In the summers of 1969-1970 and 1970-1971, investigations were undertaken to determine whether sunflower should be considered a possible crop for an irrigation project in northern Australia. Experiments were conducted on irrigated sunflower to determine the effect of time of planting on crop development, seed yield, and oil quality. In both seasons significantly higher seed and oil yields were obtained from a December planting. Lower yields at all times of planting in the second session were attributed to rust infection. A good correlation was obtained between oil quality and temperatures during the post flowering period. Oil quality improved with late sowing in association with lowered temperatures. Results of the two trials indicate that mid to late December or possibly January are the best planting months for irrigated sunflower. Rust-resistant cultivars or rust control methods would be necessary to ensure high yields in all seasons, particularly from late planted crops. (Jamail-Arizona)

SOIL MOISTURE DISTRIBUTION UNDER WIDE-BED, NARROW-ROW, AND CONVENTIONAL-ROW COTTON,
Arizona Univ., Tucson. Dept. of Soils, Water and Engineering.

H. Gessesse.
Master of Science Thesis, 1976. 51 p, 8 fig, 4 tab, 31 ref, append.

Descriptors: *Irrigation efficiency, *Irrigation practices, *Irrigation effects, *Furrow irrigation, *Moisture content, Soil moisture, Furrows, Crop production, Irrigation, Irrigation systems, Soil-water-plant relationships, Surface irrigation, Water conservation, Cultivation, *Cotton, Moisture tension, Moisture uptake.

The effect of furrow spacing on the moisture distribution pattern under cotton was investigated. Vertical and lateral soil moisture distributions were studied under two methods of row spacings. Results indicated that conventional rows had more soil moisture during the entire season, compared to wide-bed, narrow-rows. However, conventional rows received higher quantities of water at each irrigation. A large percentage of the soil moisture was depleted from the top 90 centimeters of soil under both row spacings. When average lint yields per hectare were compared, conventional row spacing with preirrigation gave best results. Conventional irrigated up, wide-bed preirrigated, and wide-bed irrigated up gave similar results. When the average seed cotton yields per hectare were compared, conventional row preirrigated, conventional row irrigated up, wide-bed, narrow-row preirrigated, and wide-bed, narrow-row irrigated up gave similiar results. (Jamail-Arizona)

Descriptors: *Corn(Field), *Irrigation practices, *Moisture stress, *Crop response, *Irrigation effects, Frequency, Droughts, Stress, Crop production, Irrigation, Irrigation water, Soil moisture, Moisture content, Field capacity, Growth stages, Semiarid climates, Root zone, Soil types, Water conservation.

A study of irrigation frequencies was carried out at the Sakha Agricultural Experimental Station in two successive growing seasons. The objective was to compare normal quantities of irrigation water used by Egyptian farmers with those calculated for the soil moisture content at the field capacity plus 10 percent to be added at different growth stages of corn. The experiment was designed according to completely random blocks of six treatments, each of eight replicates. Results show that the treatment where eight calculated waterings were applied without any drought stress during the growing season had the highest corn yield. Assuming similar field conditions, corn production in Egypt could be increased by two hundred and ten million kilograms. In addition, a great amount of irrigation water could be saved. The importance of the first irrigation is also pointed out. It's prevention significantly reduces the number of plants. (Jamail-Arizona)

DETERMINING THE MOST PROFITABLE NITROGEN FERTILIZATION FOR CORN PRODUCTION,
Tennessee Univ., Knoxville. Agricultural Experiment Station.
W. L. Parks, and J. Overton.
Tennessee Farm and Home Science Progress Report 98, April-June 1976, p 26-28. 1 fig, 3 tab. OWRT A-017-TENN(5). 14-31-001-3843.

Descriptors: *Fertilization, *Nitrogen, *Corn(Field), *Crop production, Rainfall, Soil moisture, Tennessee.

In determining the most profitable rate for nitrogen fertilization for corn, it is essential that nitrogen fertilization rate experiments be conducted at different locations in the state through several years. It is also essential that the rainfall distribution pattern and soil moisture utilization patterns during these experiments be adequately measured and complete records obtained. Once these yield data, rainfall, and moisture information have been obtained in a number of places across the state, it is possible to combine these data with the weather history that has been accumulated over much longer periods of time and arrive at the probable best nitrogen fertilization rate for use in a given area on corn. This research developed response relationships from a 3-year corn-nitrogen experiment at the West Tennessee Experiment Station at Jackson, Tennessee and expressed corn yields as a function of nitrogen (N) rate and drought intensity. (Larson-Tennessee)

EFFECTS OF SOIL-MOISTURE REGIMES ON THE GROWTH OF BARLEY,
Arizona Univ., Tucson. Dept. of Agronomy and Plant Genetics.
A. D. Day, and R. K. Thompson.
Agronomy Journal, Vol 67, No 3, p 430-432, May-June 1975. 4 tab, 9 ref.

Descriptors: *Moisture stress, *Soil water, *Barley, *Crop response, Irrigation, Irrigation effects.

Effects of soil-moisture stress at three different stages of growth (jointing, flowering, and dough) on grain yield, grain quality, and plant growth of Spring barley planted in November were studied under the field conditions at Mesa, Arizona. The experiment was conducted to determine the limitations to irrigation water conservation in a semi arid environment. Four by four Latin square designs were used to compare four irrigation treatments. Effects of soil-moisture stress for 7 days at the jointing, flowering, and dough stages of growth and/or until 100% of available water in the first 3 feet of soil was depleted were compared with plants not stressed. Withholding irrigation water during the jointing stage of growth did not reduce and in some cases increased grain yields. Moisture stress at the flowering and dough stages of growth decreased grain yield. Moisture stress at the dough lowered grain bushel-weight. Stressing barley for water at jointing resulted in shorter plants, less lodging, more tillering, and more heads per unit area. Moisture stress at flowering and the dough stage decreased seeds per head and seed weight, respectively. Cultivars differed in response to soil-moisture stress. Adequate soil-moisture must be provided throughout the growing season for maximum yields of high quality grain from Spring barley grown as a Winter-annual under irrigation. (Skogerboe-Colo St)

DIURNAL FLUCTUATION OF LEAF-WATER POTENTIAL OF CORN AS INFLUENCED BY SOIL MATRIC POTENTIAL AND MICROCLIMATE,
Agricultural Research Service, Florence, S. C. Coastal Plains Soil and Water Conservation Research Center.
D. C. Reicosky, R. B. Campbell, and C. W. Doty.
Agronomy Journal Vol. 67, No. 3, p 380-385, May-June 1975. 4 fig, 1 tab, 21 ref.

Descriptors: *Microclimatology, *Moisture stress, *Moisture tension, *Crop response, *Corn(Field), Irrigation, Irrigation effects, Crop production.
Identifiers: *Leaf water potential, *Soil matric potential.

Water stress during critical growth periods is frequently the limiting factor in crop production. However few data are available on the variation of plant water status under field conditions. The object of this work was to quantify the effect of soil matric potential on plant water status. Sweet corn was grown on a Varina sandy loam soil to determine the effect of the microclimate and irrigation on leaf water potential. Soil water stress was imposed naturally and by use of automated portable shelters that covered the plots during rainfall. Leaf-water potential was closely related to the diurnal change of incoming energy. A maximum leaf-water potential of -1.5 bars occurred just prior to sunrise. The minimum value, which occurred during the peak radiation load or stress, was dependent on soil matric potential and stage of plant development. (Skogerboe-Colo St)

VEGETATIVE WATER USE IN CALIFORNIA 1974.
California State Dept. of Water Resources, Sacramento. Water Use Programs.
Bulletin No. 113-3, April 1975. 115 p, 3 fig, 35 tab, 2 plates, 24 ref, 10 append.

Descriptors: *Evapotranspiration, *Evaporation, *California, *Irrigation, *Water demand, Hydrologic cycle, Irrigation effects, Evapotranspiration control, Water conservation, Water yield improvement, Transpiration, Vegetable crops, Irrigation water, Irrigation efficiency, Water requirements, Crop production, Water distribution(Applied), Water allocation(Policy).

One year's summary data by month, are provided for agricultural water use in California--which accounts for 85% of the state's total water use. Information is given for the three components of agricultural water use (crop-growing season evapotranspiration, applied water evapotranspiration, and applied water requirements) in estimations subdefined for the principal irrigated crops in various zones of particular agricultural importance to the state. Evaporative demand data include agroclimatic field studies, evaporative demand zones, and coastal evaporative gradient. Evapotranspiration data is given for measured evapotranspiration, correlating measured evapotranspiration to evaporation, transfer of data, correction evaluations, estimating crop growing season evapotranspiration and estimating evapotranspiration of applied water. Data on average applied water requirements is supplied for nine zones of agricultural importance, including information on high and low values found within each area. Other data supplied with the study includes a summary of observed evaporation from Class 'A' pans located in irrigated pasture environments, observed monthly net atmometer evaporation, observed incoming solar radiation, and information concerning grass evapotranspiration. WO DIMENSIONAL BOTTOM /ITHDRAWAL FROM A DENSITY-TRATIFIED RESERVOIR,
'isconsin Univ., Madison. Dept. of Civil and En-ronmental Engineering.
C. Ho, and P. L. Monkmeyer.
Proc. International Association for Hydraulic Research, XVIth Congress, p 79-86, 1975. 4 fig, 10 ref. OWRT B-080-WIS(7), 14-31-0001-3948.

Descriptors: *Model studies, Engineering, *Equations, *Reservoir releases, *Density currents, *Stratification, *Withdrawal, Model studies.
Identifiers: *Viscous flow, *Transition flow, *Sinks, *Karman integral method.

Theoretical and experimental investigations are discussed on two-dimensional withdrawal of a viscous, non-diffusive and linearly-stratified fluid from the bottom of a reservoir. To account for the non-linear, inertial terms, a Karman integral method is used to solve the governing differential equations. A program of experiments is carried out in the laboratory and the results obtained indicate conclusively the adequateness of the relatively simple form of the horizontal velocity profile assumed and confirm very well theoretical relations for the withdrawal layer thickness and maximum horizontal velocity.

A PERTURBATION APPROACH TO TWO-DIMENSIONAL BOTTOM WITHDRAWAL FROM A DENSITY-STRATIFIED RESERVOIR,
Wisconsin Univ.-Madison. Dept. of Civil and Environmental Engineering.
J. C. Ho, and P. L. Monkmeyer.
Engineering Journal of Singapore, Vol. 2, 1975, p. 12-20. 2 fig, 5 ref. OWRT B-080-WIS(6). 14-31-0001-3948.

Descriptors: *Model studies, Engineering, *Equations, *Reservoir releases, *Density currents, *Stratification, *Withdrawal.
Identifiers: *Viscous flow, *Transition flow, *Perturbation method.

A perturbation method is used to study two-dimensional withdrawal of a viscous, non-diffusive, linearly-stratified fluid from the bottom of a reservoir. From the perturbation analysis, a criterion is developed to determine the validity of the linear solution obtained by Walesh and Monkmeyer.

FLOOD PLAIN INFORMATION: TUSCARAWAS AND ADJACENT TRIBUTARY AREAS, TUSCARAWAS COUNTY, OHIO.
Army Engineer District, Huntington, W. Va.
Prepared for the Ohio Department of Natural Resources, June 1973. 28 p, 9 fig, 17 plates, 6 tab.

Descriptors: *Floods, *Streamflow forecasting, *Flood profiles, *Flood plains, *Flood data, *Dams, *Reservoirs, *Ohio, Peak discharge, Obstruction to flow, Channel improvement.
Identifiers: *Tuscarawas River(OH), Sugar Creek(OH), Dover Dam, Beaverdam Creek(OH), Stillwater Creek(OH), Little Stillwater Creek(OH), Intermediate Regional Flood, Standard Project Flood.

The Tuscarawas River, draining 2,590 square miles, constitutes nearly 1/3 of the total Muskingum River Basin in central Ohio. The 42 river miles covered in this report slope at 2.1 feet per mile and are joined by 24.19 miles of tributaries which include Sugar Creek, Beaverdam Creek, Stillwater Creek, and Little Stillwater Creek. The meandering river, with valley widths ranging between 500 and 6,000 feet, flows westward, then southwesterly through agricultural lands interspersed with some industrial, commercial and residential development. Floods occur during all seasons, though the largest have occurred in the period of December to March. Along tributaries flood stages rise to peaks with high velocities in a relatively short period of time. On the river, a flood rises to its crest over a longer period. Flood damage reduction measures include 8 reservoirs as well as a channel improvement project on Little Stillwater Creek. The greatest flood occurred in March 1913, which crested at 806.5 msld with a peak discharge of 830,000 cubic feet per second. Loss was over $200,000. Damage in a 1935 flood was $6 million. An Intermediate Regional Flood (IRF) and Standard Project Flood (SPF) can be expected to crest at 793.2 msld and 799.3 feet msld respectively. Most bridges in the study area would obstruct flow during an SPF. During major floods water velocities in the Tuscarawas River channel range up to about 4.5 ft/sec. Velocities on tributary streams having steeper gradients may be even higher. Overbank velocities are about 2 ft/sec on the river and as high as 3.2 ft/sec on tributary streams. (Salzman-North Carolina)
W77-03174

FLOOD PLAIN INFORMATION: KASKASKIA RIVER AND TRIBUTARIES, COLES COUNTY, ILLINOIS,
Army Engineer District, St. Louis, MO.
Prepared for the County of Coles, Illinois, August 1972. 28 p, 10 fig, 22 plates, 4 tab.

Descriptors: *Floods, *Historic floods, *Flood damage, *Flood protection, *Flood plains, *Flood profiles, *Illinois, Flood data, Control structures, Levee, Channel improvement.
Identifiers: *Kaskaskia River(IL), Flood Plain Management Program, Crabapple Creek(IL), Whitley Creek(IL), Flat Branch(IL), Coles County(IL), Standard Project Flood, Intermediate Regional Flood.

Kaskaskia River flows through the undulating prairie of Coles County in southeastern Illinois and falls 17.6 feet in 20.6 miles through the study reach. The river drains about 400 square miles above Coles County. Its tributaries, Crabapple Creek, Whitley Creek and Flat Branch flow westerly into the river and have flood plains which vary from 125 to 1,500 feet. Kaskaskia River's flood plains, varying from 200 to 12,000 ft wide, consist of farmlands. Floods occur during all seasons with a relatively fast rate of rise, particularly in winter when rains fall on frozen ground. Most floods result from intense rainfall. Bridges, culverts and buildings and natural obstructions impede flood flow. Channel improvements along some of the tributaries and privately built levees have reduced damage from low-frequency floods but would not protect against the Intermediate Regional Flood or Standard Project Flood. The largest flood occurred on June 28, 1957, in the aftermath downpour from Hurricane Audrey. The Kaskaskia River crested at 636.2 feet (msld). Forty thousand acres of farmland were flooded and many families were forced to evacuate their

homes. An IRF and SPF have estimated elevations of 640.2 (msld) and 646.2 (msld) and peak discharges of 19,675 cubic feet per second and 52,448 cfs, respectively. Water velocities would be up to 5 ft/sec in the channel. (Salzman-North Carolina)
W77-03175

FLOOD PLAIN INFORMATION: SAN JUAN RIVER AND TRIBUTARIES, FARMINGTON, NEW MEXICO.
Army Engineer District, Sacramento, Calif.
Prepared for the City of Farmington and San Juan County, June 1975. 53 p, 20 fig, 37 plates, 7 tab.

Descriptors: *New Mexico, *Floods, *Flood profiles, *Historic floods, *Flood plains, *Flood protection, Flash flood, Streamflow forecasting, Maximum probable flood, Cloudbursts, Flood data, Flood frequency, Peak discharge, Flood peak, Erosion, Floodways, Non-structural alternatives, Building codes, Zoning, Control structures, Dams, Channel improvement, Floodproofing.
Identifiers: *Farmington(NM), *Animas River(NM), *Hood Arroyo(NM), *San Juan River(NM), *Farmington Glade(NM), *Wyper Arroyo(NM), *La Plata River(NM), *Porter Arroyo(NM), *Flora Vista Arroyo(NM), Standard Project Flood, Intermediate Regional Flood.

Properties along the streams are primarily agricultural and rural-residential. Population of Farmington, NM, is about 28,000 and is expected to reach 50,000 by year 2000. La Plata and Animas Rivers and Farmington Glade are tributaries of San Juan River. Four arroyos, Porter, Hood, Wyper and Flora Vista, are tributaries of Animas River. The San Juan River drains 7,250 sq mi at the downstream end of the study reach and the other streams drain areas varying from 1 to 1,360 sq mi. Floods can be caused by general rainfall, usually in September and October, snowmelt in May through July, and summer cloudburst storms. The 1911 flood is considered the largest ever known in the Farmington areas with an estimated peak flow of 30,000 cubic ft per second on the Animas River at Farmington. In an Intermediate Regional Flood, peak discharges of 34,500 cfs and 30,000 cfs are expected on San Juan, La Plata and Animas Rivers, respectively. The other streams will have varying discharges below 4,000 cfs. Water velocities will be 6 to 11 ft/sec in channels and 2 to 4 ft/sec in overbank areas. Floods would peak between 2.5 and 23.5 hrs, depending on the stream and remain at critical stage up to 66 hrs. In a Standard Project Flood, peak discharges of 50,000 cfs, 22,000 cfs and 45,000 cfs are predicted on San Juan, La Plata and Animas Rivers, respectively. The other streams will have discharges less than 10,000 cfs. This flood would peak in 2.5 to 29 hrs and remain at critical stage up to 93 hrs. Some of the 30 culverts, bridges, flumes and other structures will be obstructive to flow. Navajo Reservoir, 40 mi upstream from Farmington on San Juan River, provides some flood protection. Guidelines for reducing flood damages are included. (Smith-North Carolina)
W77-03176

FLOOD PLAIN INFORMATION: CONTOOCOOK RIVER AND NUBANUSIT BROOK, PETERBOROUGH, NEW HAMPSHIRE.
Army Engineer District, Waltham, Mass. New England Div.
April 1974. 35 p, 21 fig, 18 plates, 6 tab.

Descriptors: *Floods, *Flood data, *Flood stages, *Peak discharge, *Flood characteristics, *Bank erosion, *Flood plains, *Channels, *Ice jams, *Flood protection, *Dams, Flood flow, Historic floods, Flow duration, Control structures, *New Hampshire, Flood profiles.
Identifiers: *Contoocook River(NH), Nubanusit Brook(NH), Peterborough(NH), Flood Plain Management Program, MacDowell Reservoir(NH), Intermediate Regional Flood, Standard Project Flood.

The Contoocook River flows northerly through Peterborough, NH and discharges into the Merrimack River. With a total drainage area of 151 square miles above the study area, the river has a very steep, narrow stream valley through town's business district, sloping at an average of 16.1 feet per mile. Nubanusit Brook, which joins the river at Peterborough, drains 47 square miles and has a slope averaging 69.3 ft per mile. Flood plains in study area include residential, industrial and commercial property; however, deep channels confine most flooding within banks except beyond the business district where streams meander through broader flood plains. The MacDowell Flood Control Reservoir (1950) on the Nubanusit Brook minimizes flooding. Ice jams resulting from spring melting still constitute a problem. Floods occur during all seasons. River stages rise rapidly because of the river's numerous steep tributaries. September 1938 marked the greatest flood on the Contoocook River, cresting at 746.8 ft mean sealevel datum, with a peak discharge of 5,950 cubic ft/sec. Damage was over $500,000. An Intermediate Regional Flood and Standard Project Flood would have estimated peak discharges of 6,650 cfs and 10,650 cfs, respectively. Water velocities could reach 14 ft/sec in major floods. Similar flood conditions would result on Nubanusit Brook. Few bridges in the area would obstruct flood flow. (Salzman-North Carolina)
W77-03177

FLOOD PLAIN INFORMATION: CHICOPEE RIVER: CHICOPEE, SPRINGFIELD, LUDLOW, WILBRAHAM AND PALMER, MASSACHUSETTS.
Army Engineer District, Waltham, Mass. New England Div.
September 1973. 38 p, 20 fig, 10 plates, 5 tab.

Descriptors: *Floods, *Runoff, *Flood plains, *Flood protection, *Control structures, Flow duration, Flow characteristics, Flood data, Channel improvements, Floodwalls, Dams, Reservoirs, Planning, Obstruction to flow, Flood profiles, *Massachusetts.
Identifiers: *Chicopee River(MA), Quaboag River(MA), *Ware River(MA), *Swift River(MA), Springfield(MA), Chicopee(MA), Palmer(MA), Ludlow(MA), Wilbraham(MA), Flood damage reduction measures, Bare Falls Dam(MA), Conant Brook Dam(MA).

Flowing from its source at the confluence of the Ware and Quaboag Rivers near the community of Three Rivers in the town of Palmer, to its confluence with the Connecticut River at Chicopee, the river drains 721 sq mi and has three principal tributaries: the Quaboag, Ware and Swift Rivers. A number of smaller streams in the river system can also be sources of high runoff during intensive rain or rapid snowmelt. Certain areas of the usually narrow flood plain extend to 2,000 feet and contain residential, commercial and industrial development as well as open spaces under increasing pressure for development. Each of the five towns can be severly damaged by future floods. Floods occur during all seasons, particularly in Spring when snowmelt augments rainfall. Peak flood stages occur 6 to 24 hours after intense rainfall. Most of the 14 bridges spanning the river would obstruct flood flows in an Intermediate Regional Flood (IRF). Flood damage reduction measures include several local protection flood control projects, such as channel modifications, flood walls, dams and reservoirs. Highest recent flood occurred August 19, 1955 when the river crested at 22.14 ft and had a peak discharge of 40,500 cubic ft/sec. An IRF would crest at 16.5 ft, have a peak discharge of 35,500 cfs with channel velocities of 6-9 ft/sec. A Standard Project Flood would crest at 26.6 ft and have a peak discharge of 77,800 cfs with velocities averaging 8 to 12 ft/sec. (Salzman-North Carolina)
W77-03178

FLOOD PLAIN INFORMATION METROPOLITAN REGION, LINCOLN NEBRASKA: VOLUME I, SUMMARY REPORT SALT CREEK, HAINES BRANCH AND BEA SLOUGH, SALT CREEK BASIN.
Army Engineer District, Omaha, Nebr.
Prepared for Lincoln City-Lancaster Count Planning Commission. August 1964. 10 p, 5 fig, 1 plates.

Descriptors: *Nebraska, *Floods, *Flood profile *Historic floods, *Flood plains, Storms, Floo data, Snowmelt, Flood protection, Non-structur alternatives, Flood plain zoning, Building code Control structures, Reservoirs, Floodproofing.
Identifiers: Lincoln(NB), Beal Slough(NB), *Sa Creek(NB), Haines Branch(NB), 25-year floo 100-year flood.

The lower portions of the watersheds of t streams of this study are generally developed and around Lincoln, NB, while the upper portio are used for crops or pasture. Haines Branch is tributary of Salt Creek which is formed by t junction of the Olive and Hickman Branches. Be Slough enters Salt Creek at Lincoln. Lincoln co tinues to grow and its 1960 population of 128,000 expected to reach 231,000 by 1980. Flooding c be caused by heavy general rains in spring a summer, combined with snowmelt. On rare occ sions snowmelt alone causes flooding. Since 190 100 floods have been recorded along Salt Cre and tributaries, of which 17 were major, 30 we moderate and 49 were minor. Two inflict catastrophic damages. The highest peak dischar was 30,650 cubic ft/sec in a 1908 event. A 19 flood had a peak of 28,200 cfs and caused damag of $1.6 million in Lincoln. No predictions of pe discharges for future large floods is contained this report, but flood plains are delineated on ma for the 25-year and 100-year flood. Guidelines a given for floodplain management. At the time this report, 5 storage structures on upstream trib taries of Salt Creek and one on a Haines Bran tributary had been authorized. For detailed flo plain and technical information consult the m report. (Smith-North Carolina)
W77-03179

FLOOD PLAIN INFORMATIO METROPOLITAN REGION, LINCOL NEBRASKA, VOLUME II, SUMMARY R PORT, ANTELOPE CREEK, DEAD MANS RU AND MIDDLE CREEK, SALT CREEK BASIN.
Army Engineer District, Omaha, Nebr.
Prepared for Lincoln City-Lancaster Coun Planning Commission, April 1966. 10 p, 5 fig, plates.

Descriptors: *Nebraska, *Floods, *Flood profil *Flood plains, *Flood protection, Flood foreca ing, Historic floods, Non-structural alternativ Building codes, Control structures, Water contr Identifiers: *Antelope Creek(NB), Dead Ma Run(NB), *Middle Creek(NB), Lincoln(NB), year flood, 100-year flood, Flood plain zoning.

Antelope Creek and Dead Mans Run are rig bank tributaries of Salt Creek and rise within t Lincoln metropolitan area. They drain 14 and 1 sq mi, respectively. Middle Creek, a left ba tributary of Salt Creek, drains about 100 sq Urban development is concentrated within L coln city limits, while other lands are more ru and devoted to pasture and crops. Lincoln a vicinity are expected to continue to grow, so th staggering losses which have occurred in floo plains in the past may be increased unless flo protection is established. Floods generally occur spring and summer months and are sometimes creased by snowmelt. On rare occasions snowm alone may cause flooding. Since 1900, 8 floods the Antelope Creek basin have been recorded a heavy damages have occurred. No floods ha been recorded on Middle Creek and two floo have occurred on Dead Mans Run. A 1951 flood Antelope Creek caused damages estimated

U. of I. URBANA-CHAMPAIGN

2,000. This report does not predict peak charges of possible future large floods, but information on 25-year floods and 100-year floods is en in the form of flood plain delineation maps. ıor flood protection has been given by conction of 3 storage structures, one on Antelope ek near Van Dorn Street, two on the upstream ches of Middle Creek. At each of the stream's fluences with Salt Creek, a protective works to rd against backwater effects of Salt Creek is posed. Guidelines for floodplain management given. (Smith-North Carolina)
7-03180

)OD PLAIN INFORMATION: TROPOLITAN REGION, LINCOLN, BRASKA, VOLUME III, SUMMARY RE-RT, LITTLE SALT, OAK, SALT, AND EVENS CREEK, SALT CREEK BASIN.
ıy Engineer District, Omaha, Nebr.
ɔared for Lincoln City-Lancaster County ıning Commission, September 1967. 12 p, 7 fig, lates.

criptors: *Nebraska, *Floods, *Flood profiles, ɔod plains, Historic floods, Peak discharge, ɔd protection, Non-structural alternatives, trol structures, Dams, Channel improvement. ıtifiers: *Little Salt Creek(NB), *Oak ek(NB), *Salt Creek(NB), *Stevens ek(NB), Lincoln(NB), 25-year flood, 100-year d.

le Salt and Oak Creeks are left bank tributaries alt Creek and drain 47 and 272 sq mi, respecly. Stevens Creek, a right bank tributary, ns 55 sq mi and enters Salt Creek just nstream of Lincoln. Except for the ropolitan reach of Oak Creek and several rural munities, the basins of the tributary streams ıis report are undeveloped. Salt Creek, which ns 1,627 sq mi has, in contrast, major develop-t along it within the city limits of Lincoln. ough Lincoln is predicted to continue its vth, little expansion is expected in the reaches hese streams. Floods occur most often in ng and summer months, when rain is heavy or ombined with snowmelt. On rare occasions vmelt alone can cause flooding. Only two or floods have occurred on Oak Creek, in 1945 1947 and damage was relatively small. Since , 17 major and 83 minor floods have been rded on Salt Creek and major damage has caused. In a 1951 flood a peak discharge of 00 cubic ft/sec was recorded. Peak discharges ɔossible future large events are not given, but d plain delineation maps which show the ex-of 25-year and 100-year floods are included. e channel improvement has taken place on and Salt Creeks, but protection is small. A ɔs of Engineers project which includes dams other possible improvements would aid in d protection. Guidelines for floodplain agement are given. (Smith-North Carolina)
-03181

OD PLAIN INFORMATION: WILDCAT EK AND KOKOMO CREEK, VICINITY OF KOMO, HOWARD COUNTY, INDIANA.
y Engineer District, Louisville, Ky.
ared for the City Planning Commission of ɔmo and Howard County Planning Commis-July 1972. 42 p, 17 fig, 11 plates, 11 tab.

riptors: *Floods, *Flooding, *Flood forecast-*Flood data, *Flood protection, *Non-struc-alternatives, *Flood plain zoning, *Levees, iana, Runoff, Flood flow, Historic floods, d stages, Peak discharge, Flow duration, characteristics, Flood damage, Flood plains, ructions to flow, Flood profiles, Flash floods. tifiers: *Wildcat Creek(IN), *Kokomo k(IN), Kokomo(IN), Howard County(IN), dard Project Flood, Intermediate Regional d.

This report covers 12.2 miles of Wildcat Creek, from mile 58 to the dam at the Kokomo Waterworks Reservoir at mile 70.2, and Kokomo Creek, from its mouth to the gaging station at mile 4.42. Varying in width from 200 to 500 feet, the flood plains have industrial, commercial and residential developments in and near Kokomo. Within the study reach, the stream beds fall at an average of 7.3 feet per mile. Main flood season occurs in winter and early spring resulting from heavy rains; however, summer thunderstorms can create flooding conditions also. In the open channels, water velocities range up to 13.8 ft/sec and floods have a relatively short duration and fast rate of rise. Flood damage prevention measures include structural levees, flood plain zoning, subdivision regulations and flood warning and forecasting services. Natural obstructions as well as 46 bridges, 4 dams, and levees impede flood flows. Although the greatest known flood occurred in March 1913, the largest recorded flood was in April 1964 with an elevation of 817.6 feet (gage zero is 755.62 feet). Similar levels of flooding occurred on Wildcat Creek. An Intermediate Regional Flood and Standard Project Flood on Kokomo Creek are estimated to crest at 818.9 ft and 829 ft, and have peak discharges of 2,300 cubic feet per second and 6,500 dfs respectively. On Wildcat Creek the IRF and SPF would peak at 16,200 cfs and 4,500 cfs respectively. (Salzman-North Carolina)
W77-03182

FLOOD PLAIN INFORMATION: SCIOTO AND OLENTANGY RIVERS, OHIO, COLUMBUS AREA, SUMMARY REPORT.
Army District Engineers, Huntington, W. Va.
Prepared for the State of Ohio Department of Natural Resources. Prepared by Dodson, Kinney and Lindblom, Columbus, October 1966. 23 p, 16 fig, 13 plates, technical append.

Descriptors: *Ohio, *Floods, *Non-structural alternatives, *Control structures, *Flood plains, Flood profiles, Obstructions to flow.
Identifiers: *Scioto River(OH), *Olentangy River(OH), Chillicothe(OH), Columbus(OH), Julian Griggs Reservoir(OH), Paint Creek(OH), North Fork(OH).

This report covers Scioto and Olentangy Rivers in the Columbus OH area and the Scioto River, Paint Creek and its tributary, North Fork, in the Chillicothe OH area. In Columbus, the Scioto's flood plains as well as the narrow flood plains of the Olentangy are extensively developed with residential and commercial properties, bridges and roadways. Outside of the urban area, the flood plains are primarily for agricultural purposes. The greatest flood occurred in March 1913 causing damages to $5.6 million. This could be repeated in the future. Flood control improvements include 4 reservoirs, of which only one has been built, channel improvements, levees and a variety of flood plain regulations. Guidelines for reducing future flood damages are outlined. These measures include: (1) flood control works such as dams and reservoirs, levees, flood walls, channel improvements and watershed treatment; and (2) flood plain management techniques such as channel and floodway encroachment lines, zoning ordinances, subdivision regulations, building codes, floodproofing and warning systems. This report serves as a guide for adoption of suitable flood plain regulations and management techniques. (Salzman-North Carolina)

FLOODFLOW CHARACTERISTICS AT PROPOSED BRIDGE SITE ABOVE SHERWOOD ROAD ON WEST BRANCH DELAWARE RIVER, DELHI, NEW YORK,
Geological Survey, Albany, N. Y. Water Resources Div.
B. Dunn, and T. J. Zembrzuski, Jr.
Open-file report 76-778, November 1976. 10 p, 3 fig, 4 tab, 6 ref.

Descriptors: *Flood flow, *Flood frequency, *Flood recurrence interval, *Bridge design, Streamflow, Hydraulic properties, Flow characteristics, Flow resistance, Flood forecasting, *New York.
Identifiers: *West Branch Delaware River(NY), *50-year flood, *100-year flood.

An evaluation of floodflow characteristics for a 50- and 100-year flood was made for a proposed bridge site across West Branch Delaware River in Delaware County, N.Y. Several design conditions were analyzed for their effect on the 100-year profile. Analyses were made to determine the effect of both removal and retention of the existing Sherwood Road bridge and roadway embankment 750 feet downstream from the proposed site. The normal water-surface elevation (without the bridge) at the proposed site would be 1,345.2 feet for the 50-year flood and 1,345.6 feet for the 100-year flood if the existing Sherwood Road bridge and embankment were retained, and would be 1,344.8 feet and 1,345.1 feet for the 50- and 100-year flood, respectively, if the bridge and roadway embankment were removed. The magnitudes of the 50- and 100-year floods at the proposed site would be 8,300 cubic feet per second and 9,300 cubic feet per second, respectively. (Woodard-USGS)

PROBABLE MAXIMUM FLOOD AT LAKE CHIPPEWA NEAR WINTER, WISCONSIN,
Geological Survey, Madison, Wis. Water Resources Div.
W. R. Krug.
Open-file report 76-800, November 1976. 14 p, 7 fig, 3 tab, 6 ref.

Descriptors: *Maximum probable flood, *Lakes, Dams, *Simulation analysis, *Reservoir operation, Streamflow, Inflow, *Wisconsin.
Identifiers: *Lake Chippewa(Wisc).

The probable maximum flood was computed for Lake Chippewa, Wisconsin, and routed through the lake to determine maximum lake stage. The peak discharge of the probable maximum flood at Lake Chippewa was computed to be about 75,000 cubic feet per second, primarily caused by rainfall on the lake. A secondary peak of about 41,000 cubic feet per second was due to streamflow entering Lake Chippewa. The 14-day volume of this flood was 450,000 acre-feet. Using an assumed operating procedure for Winter Dam, the maximum lake stage for the probable maximum flood was computed to be about 1,318 feet above mean sea level--about 3 feet below the dam crest and 6 feet above the proposed normal summer operating level. The probability of this flood occurring in any year is less than 1 in 10,000. (Woodard-USGS)

PLAN FOR IMPROVEMENT OF THE DELTA LEVEES.
California State Dept. of Water Resources, Sacramento.
Bulletin No. 192, May 1975. 28 p, 7 fig, 3 tab.

Descriptors: *Flood control, *Levees, *Deltas, *California, Multiple-purpose projects, Recreation facilities, Shore protection, Cost-benefit analysis, Estimated costs, Capital costs, Annual costs, Estimated benefits, Financing, Design.
Identifiers: *Sacramento-San Joaquin Delta(Calif).

A plan to solve some of the Sacramento-San Joaquin Delta flood control, levee maintenance, shortage of public access and recreation facilities, and lack of adequate land use control problems is proposed. A total of 310 miles of levees that surround portions of 55 islands or tracts would be improved, 45 miles to a 100-year flood level and 265 miles to provide 50-year protection. The latter would only be adequate for agricultural land use. The plan also provides for 50 recreation access sites, 40 of which would be for fishing access, improved roads, and enhancement of the environment. The preliminary capital cost is estimated to be $128 million to be shared by federal, state and local sources on a 50%, 30%, 20% basis respectively. About 90% of this total cost involves flood control measures. Annual operation, maintenance, and replacement costs of approximately $1.1 million would be funded by local and state groups. The project is expected to be completed over a 20-year period. An economic analysis of the project indicates that approximately $7 million of primary direct annual benefits would accrue from the project compared to an estimated total equivalent annual cost of $5.5 million. In addition, large secondary monetary benefits and social and environmental benefits are anticipated. (Luedtke-Wisconsin)

CORPS' NEW LOOK IN FLOOD CONT NO DAMS, LEVEES,
M. Zeldin.
Audobon, Vol 77, p 103-04, July 1975. 2 p.

Descriptors: *Nonstructural alterna *Administrative agencies, Civil engine *Floodproofing, *Flood control, Flood da Flood discharge, Flood plain insurance, protection, Flood routing, Relocation, Water control, Water storage, Barriers, Dam struction, Surface drainage, Surface runoff face waters.
Identifiers: *Army Corps of Engineers, * Resources Development Act.

The Army Corps of Engineers has always known for its policy of 'build now, and ther some more later'. This policy is changing und terms of Section 73 of the Water Res Development Act. It requires all federal ag planning flood control projects to give cons tion to nonstructural alternatives to prev reduce flood damages. This includes floodpr of structures, floodplain regulation and a tion, and relocation where necessary. En

ntal groups will now, for the first time, have a nce to work with the Corps of Engineers in nning suitable construction projects and recom-nding alternatives. Examples of the Corps' new milder tactics can be found at Prairie du en, Wisconsin, the Charles River watershed, ssachusetts, and the Chatfield Dam on the th Platte River, not far from Denver, orado. ntifiers: Satpura region(Ariz).

drilling of 500 tube wells in the Satpura region Central India is described. The geology of the a, the history of water development there, and impact of improved water services are cussed. Geologically, the area is underlain by stalline rocks, basalts and sandstones. Ground-er flow systems are of the local and inter-liate type. Well data are analyzed, and the ilts presented. Wells drilled in valleys and flat ands were the most productive and average l yields in crystalline rocks were greater than se in basalts or sandstones. Topographic loca-and fracturing were considered to be the dominant factors affecting well yields in the stalline rocks. Well yield and specific capacity ilts were compared to results from areas of ilar geology. (Jamail-Arizona)

BURIED AQUIFERS IN THE BROOTEN-BELGRADE AND LAKE EMILY AREAS, WEST-CENTRAL MINNESOTA--FACTORS RELATED TO DEVELOPING WATER FOR IRRIGATION,
Geological Survey, St. Paul, Minn. Water Resources Div.
R. J. Wolf.
Water-Resources Investigations 76-100, September 1976. 72 p, 18 fig, 7 plates, 3 tab, 16 ref.

Descriptors: *Groundwater resources, *Irrigation wells, *Water yield, *Aquifer characteristics, *Water quality, *Minnesota, Hydrogeology, Well data, Test wells, Water pollution sources.
Identifiers: West-Central Minnesota, Brooten-Belgrade area(Minn), Lake Emily area(Minn).

Irrigation has given a substantial boost to the economy in the Brooten-Belgrade and Lake Emily areas of Minnesota. The surficial outwash aquifer is capable of yielding sufficient quantities of water for irrigation over half of its area; the remaining part may be supplied by deep aquifers. Buried glacial outwash and Cretaceous sand aquifers, as thick as 50 feet occur to depths of 300 feet. In places, the buried aquifers are sufficiently thick and permeable to yield large quantities of water to wells. The buried aquifers are probably narrow, elongate, truncated bodies enclosed by clay till. The Precambrian surface, ranging from 190 to 350 feet below the land surface, is the lower limit of the buried aquifers. Water in the buried-drift aquifers is a very hard calcium magnesium bicarbonate type, suitable for irrigation needs. Water in Cretaceous aquifers, although untested, is expected to be higher in dissolved solids. Potenial water problems include slow rate of recharge to buried aquifers, and head loss caused by screening of the surficial and buried aquifers in the same well, and by allowing well to flow unabated. Another potential problem is possible pollution of the buried aquifers through the boreholes of multiaquifer wells. (Woodard-USGS)

PLAN OF STUDY OF THE HYDROLOGY OF THE MADISON LIMESTONE AND ASSOCIATED ROCKS IN PARTS OF MONTANA, NEBRASKA, NORTH DAKOTA, SOUTH DAKOTA, AND WYOMING.
Geological Survey, Denver, Colo.
Open-file report 75-631, December 1975. 35 p, 5 fig, 2 tab, 43 ref.

Descriptors: *Groundwater resources, *Coal mines, *Montana, *Nebraska, *North Dakota, Water demand, Planning, Available water, Hydrogeology, Aquifers, Aquifer characteristics, Limestones, Rocks.
Identifiers: *Madison limestone.

A major part of the United States' coal reserves is in the Fort Union coal region of the Northern Great Plains. Large-scale development of these reserves would place a heavy demand on the area's limited water resources. Surface water is poorly distributed in time and space. Its use for coal development in parts of the area would require storage reservoirs and distribution systems, whereas in the rest of the area surface water is fully appropriated and its use would deprive present users of their supply. Preliminary studies by the U.S. Geological Survey and State agencies in Wyoming, Montana, and South Dakota indicate that the Madison Limestone and associated rocks might provide a significant percentage of the total water requirements for coal development. This report briefly summarized the present knowledge of the geohydrology of the Madison and associated rocks, identifies the need for additional data, and outlines a 5-year plan for a comprehensive study of the hydrology of these rocks. (Woodard-USGS)

HYDROLOGIC STUDIES BY THE U.S. GEOLOGICAL SURVEY IN OIL-SHALE AREAS OF COLORADO, UTAH, AND WYOMING, 1976.
Geological Survey, Denver, Colo.
Open-file report, February 1976. 88 p, 13 fig, 12 tab, 14 ref.

Descriptors: *Water resources, *Water quality, *Oil shales, *Mine wastes, Surface waters, Groundwater, Data collections, *Colorado, *Utah, *Wyoming, Streamflow, Flow rates, Gaging stations, Reservoirs, Soil moisture, Groundwater movement, Water wells, Chemical analysis, Sediment transport, Path of pollutants, Hydrologic data.

The U.S. Geological Survey has for many years maintained a program of water-resources investigations that includes the oil-shale areas of Colorado, Utah, and Wyoming. The recent interest in oil shale has added new dimensions and greater intensity to the investigations. This report describes the water-resources investigation pro-

gram that is currently in operation. Locations of gaging stations and water-quality measuring sites, frequencies and parameters, and areas of groundwater studies are included. Brief descriptions of studies by investigators who are headquartered outside the Geological Survey's district operations also are included. These studies are research related to oil shale, chemical exchanges in waste material, extraction, water quality, and post-mining reclamation. (Woodard-USGS)

SUMMARY OF GEOLOGY AND GROUNDWATER RESOURCES OF PASSAIC COUNTY, NEW JERSEY,
Geological Survey, Trenton, N.J. Water Resources Div.
L. D. Carswell, and J. G. Rooney.
Water-Resources Investigations 76-75, June 1976. 47 p, 7 fig, 1 plate, 3 tab, 25 ref.

Descriptors: *Groundwater resources, *Aquifer characteristics, *Well data, *Water yield, *Water quality, *New Jersey, Hydrogeology, Geologic mapping, Water utilization, Groundwater recharge.
Identifiers: Passaic County(NJ).

The Brunswick Formation of Triassic age is the most important aquifer in the southeastern one-third of Passaic County, N. J. Yields of public supply and industrial wells range from 50 to 510 gal/min and the median yield is 130 gal/min. Most of these wells are 200 to 400 feet deep. The median yield of all public supply and industrial wells over 300 feet deep and 8 inches or larger in diameter is 230 gal/min. Crystalline rocks of Precambrian age are the major source of ground water for domestic use in the northwestern two-thirds of Passaic County. Well yields range from 1 to 200 gal/min. The median yield of domestic wells is 5 gal/min and that of public supply wells is 30 gal/min. Unconsolidated stratified deposits of Quaternary age are potentially an important source of ground water for future development. Yields of wells tapping the stratified deposits range from 4 to 920 gal/min. The median reported yield of domestic wells is 16 gal/min and that of public supply and industrial wells is 130 gal/min. The quality of ground water in Passaic County varies from one aquifer to another. Water from the Precambrian rocks is soft to moderately hard (34 to 104 mg/liter) and is low in dissolved solids (66 to 159 mg/liter). Water from the Brunswick Formation is moderately hard to very hard (89 to 540 mg/liter). The dissolved solids content ranges from 129 to 563 mg/liter. Groundwater pumpage by the major public supply companies in the county has increased from 2.1 million gallons per day in 1951 to 4.39 million gallons per day in 1968. (Woodard-USGS)

GROUND-WATER RESOURCES OF GREELEY AND WICHITA COUNTIES, WESTERN KANSAS,
Geological Survey, Lawrence, Kans. Water Resources Div.; and Geological Survey, Lawrence, Kans.
S. E. Slagle, and E. C. Weakly.
Kansas Geological Survey, Lawrence, Irrigation Series No 2, June 1976. 21 p, 10 fig, 3 plates, 3 tab, 41 ref, append.

Descriptors: *Groundwater resources, *Aquifer characteristics, *Water wells, *Water yield, *Water quality, Water utilization, Irrigation wells, Pumping, Water level fluctuations, Groundwater recharge, Available water, *Kansas.
Identifiers: Greeley and Wichita Counties(Kans), Groundwater storage.

Unconsolidated deposits of sand, silt, clay, and gravel compose the principal aquifer in Greeley and Wichita Counties, Kans. The deposits are as much as 300 feet thick, of which as much as 145 feet is saturated. In 1972, there were about 1,040 large-capacity wells-yielding 100 gallons per minute or more--in the counties, mostly for irrigation supplies. The wells yield as much as 2,000 gallons per minute. Withdrawals of ground water average about 220,000 acre-feet annually. Water levels have declined in parts of the area where large-capacity wells are concentrated, resulting in as much as 60-percent reduction in saturated thickness. Water-level declines during 1948-72 ranged from less than 10 to about 55 feet. The largest decline, about 55 feet, has occurred near Leoti, in central Wichita County. As of January 1972, about 5 million acre-feet of ground water were in storage in Greeley and Wichita Counties; however, only about 70 percent of this amount is considered to be available for pumping. The water from the unconsolidated aquifer is a mixed chemical type in which calcium, sodium, and bicarbonate are the principal constituents. Generally, the water is suitable for all common domestic, stock, an irrigation uses. (Woodard-USGS)

CALIFORNIA'S GROUND WATER.
California State Dept. of Water Resources, Sacramento. Div. of Planning.
Bulletin No. 118, September 1975. 145 p. 33 fig., tab.

Descriptors: *Groundwater basins, *California Surveys, Water supply, Water resources development, Groundwater, Water utilization, Groundwater recharge, Groundwater resources, Management, Surface-groundwater relationships, Conjunctive use.
Identifiers: Groundwater law.

Technical information on groundwater basins, th extent of their water supplies, the ways in whic they have been used and misused, and bett management mechanisms for the future a discussed. The usable storage capacity of Califo nia groundwater basins is about 143 million acr feet. About 40% or 15 million acre-feet per year California's applied water needs is obtained fro them, and there is an overdraft of 2.2 million acr feet per year. With the exception of dissolved sal problems in some basins, groundwater quality suitable for all beneficial uses. The developme of computers capable of solving many equatio simultaneously has allowed use of mathematic models of the basins' hydrology to evaluate alte native water management plans. It is conclud that: (1) water could be pumped from some basi to support industries such as the thermal electr power industry, which have an economic life sho enough to be supplied by the available water; (groundwater has been the single most importa resource contributing to the present developme of the state's economy and use of basin storag capacity offers the largest potential benefit fro management of the state's resources, (3) so basins with large supplies of inexpensive surfa water require well fields to prevent draina problems due to rising groundwater levels. An i ventory of the groundwater resources, divid into nine hydrologic study areas, is also provide (Luedtke-Wisconsin)

GROUND WATER BASIN PROTECTION PR JECTS: FREMONT SALINITY BARRIER.
California State Dept. of Water Resources, Sacr mento.
Bulletin No. 147-2, June 1975. 12 fig, 4 tab.

Descriptors: *Aquifer management, *Saline wat barriers, *Groundwater recharge, Saline wat Saline water intrusion, Saline-freshwater int faces, Seepage, Subsurface waters, Estuari California, Groundwater barriers, Groundwat movement, Aquifers, Reservoirs, Water polluti sources, Subsurface waters, Water resourc development, Encroachment, Design, Estimat costs, Wells, Environmental effects, Well casing
Identifiers: San Francisco Bay, Alameda Co ty(Calif).

A salt water-intruded ground water reservoir in t Fremont area of southern Alameda Coun California can be restored and maintained as a us ble resource only if three simultaneous actions a taken, according to a water basin protection stud (1) planned recharge of natural and import waters; (2) removal from the ground water res voir of salt water remaining from earlier int sions; and (3) installation of a barrier to preve additional salt water from entering the reservo Description is given of current efforts to rechar aquifers in the Fremont ground water area throu utilization of spreading basins along Alame Creek, along with present and proposed work remove entrapped salt water by means of aquif reclamation wells and pumping into flood cont and drainage canals. The proposed undergrou

water intrusion barrier would be installed
een San Francisco Bay and the aquifers,
ing an irregular line along the landward edge
ne saltwater evaporation ponds west of Fre-
t and extending about nine miles. Estimated
of the six-year project would be slightly more
$3 million. A pumping type of barrier is
mmended, to avoid trapping saline water in
iously-unaffected areas or forcing already-in-
ed saline waters further inland, and to ac-
ate removal of entrapped saline water from
quifer. (Harris-Wisconsin)

THE RESPONSE OF NATURAL CHANNELS TO URBANIZATION: TWO CASE STUDIES FROM SOUTHEAST ENGLAND,
University Coll., London (England). Dept. of Geography.
G. E. Hollis, and J. K. Luckett.
Journal of Hydrology, Vol. 30, No. 4, p 351-363, 1976. 3 fig, 2 tab, 19 ref.

Descriptors: *Urban hydrology, *Urbanization, *Open channels, *Channel morphology, *Cross-sections, Hydraulics, Natural streams, Urban sociology, Foreign countries, Foreign research, On-site investigations.
Identifiers: *Urban channels, *England, *Channel enlargement.

The hypothesis that natural channels become enlarged as a result of an increase in flood flows following urbanization was tested in two areas of southeast England. The first study involved the use of a regression equation in urban basins to predict channel size prior to urbanization. The second study compared measurements made on the same channels in 1956 and 1970, a period during which the basin went from rural to 18% paved. Both studies showed increases in channel size, but this could not be confirmed by a difference of means test suited to paired observations. (Terstriep-ISWS)

Descriptors: *Pennsylvania, *Unit hydrographs, *Precipitation(Atmospheric), Watersheds(Basins), Seasonal, Floods, *Model studies, *Lent squares method.
Identifiers: *Watershed parameters, *Climatic effects, *Flood events, Storm variables, Hydrologic regions, Seasonal differences.

Some 96 flood events larger than the mean annual flood from 16 watersheds in the Commonwealth of Pennsylvania were used to derive unit hydrographs by the least-squares method. Analyses of the unit hydrographs were conducted to ascertain their response to watershed parameters, climatic and storm variables and locations within different hydrologic regions. Significant differences both within and among watersheds led to the formulation and testing of hypotheses stating that differences among watersheds are caused by physiographic differences while differences within watersheds result from climatic and storm differences. The analysis showed, that while many watersheds parameters strongly influence the shape of the unit hydrograph, only the storm variables duration and volume of precipitation excess produce significant differences. Seasonal differences were apparent but not proven statistically significant. (Sink-Penn State)

AFFORESTATION IN LOW RAINFALL AREAS,
Department of Forestry, Pretoria (South Africa).
P. J. Le Roux.
South African Forestry Journal, No. 93, p 1-6, June, 1975. 11 fig, 1 ref.

Descriptors: *Reforestation, *Forest management, *Erosion control, *Forestry, Rainfall, Precipitation(Atmospheric), Erosion, Terracing, Percolation, Forest soils, Forests, Soil moisture, Runoff, Infiltration, Vegetation establishment, Planting management.

Reforestation techniques in arid zones of Spain, Italy, Greece, and Israel were studied, and methods employed in soil preparation, the planting techniques, and the species planted are described. The main objectives of reforestation in Italy, Spain, and Greece are to prevent erosion, establish a green landscape, and form a layer of humus to assist in future reforestation. In low rainfall areas, the eradication of the natural vegetation, which will otherwise compete with the young trees, is considered of vital importance. The reforestation techniques of Israel are discussed separately. Large-scale reforestation has been undertaken in Israel during the past two decades in areas of low rainfall. In these areas, the growth of trees is affected mainly by soil moisture. To achieve the required results, various methods of soil preparation have been devised to improve infiltration of rainwater, to reduce runoff, and to reduce soil moisture losses through evaporation as well as losses due to transpiration of competing vegetation. The aims of the reforestation program in Israel are also presented. (Jamail-Arizona)

LOW FLOW MODELING IN SMALL STEEP WATERSHEDS,
Utah Water Research Lab., Logan.
D. S. Bowles, and J. P. Riley.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 102, No. HY9, Proceedings Paper 12405, p 1225-1239, September 1976. 10 fig, 12 ref, 2 append.

Descriptors: *Groundwater, *Low flow, *Washington, Model studies, Computer models, Hydrology, Mathematical models, Mountain forests, Small watersheds, Streamflow, Flow.
Identifiers: *Simulation, *Soil water storage, Systems engineering, Mountain watersheds, Low streamflow.

On some small, steep mountain watersheds, the magnitude of low streamflow is almost uniform for prolonged periods. This phenomenon was exhibited by three small drainage areas within the Entiat Experimental Forest of central Washington State. On these watersheds, about two-thirds of the annual precipitation was in the form of snow. Annual hydrographs for each area were characterized by an almost uniform flow with a complex snowmelt hydrograph superimposed between March and August. The only distinct recession curve occurred at the end of the snowmelt season

and continued to decrease until a relatively uniform streamflow typified by the watershed was reached. In a computer simulation study of the three drainage areas, a linear groundwater reservoir submodel based on the recorded streamflow recession curves was found to be inadequate during low flow periods. Modifications of the subsurface part of the simulation model to improve the representation of the prolonged period of relatively uniform low flows were described in this paper. (Roberts-ISWS)

PRECIPITATION CHEMISTRY STUDIES AT LAKE GEORGE: ACID RAINS,
Rensselaer Polytechnic Inst., Troy, N. Y. Dept. of Chemical Engineering and Rensselaer Polytechnic Inst., Troy, N. Y. Dept. of Environmetal Engineering.
G. J. Stensland.
Rensselaer Fresh Water Institute at Lake George Newsletter, Vol. 6, No. 1, p 1-3, February 1976. 1 fig, 2 tab.

Descriptors: *Chemistry of precipitation, *Precipitation(Atmospheric), *Acidic water, *New York, Acids, Air pollution, Pollutants, Sampling, Rainfall, Chemistry, Chemical analysis, Hydrogen ion concentration, Sulfates, Winds, Meteorology.
Identifiers: *Lake George(NY).

The mechanisms by which rains have become progressively more acidic over a period of years are not yet well understood. During the summer of 1975, a precipitation chemistry field study was conducted at the Fresh Water Institute facilities at Lake George. The major thrust of the effort was to collect sequential samples for each rain event. The ultimate goal was a clearer understanding of the scavenging processes leading to acid rains. For the 492 samples collected, the highest pH was 6.2, the lowest 3.1; the typical values were in the range of 3.2 to 4.5. The pH and the ion concentrations were extremely variable during single rain events. (Sims-ISWS)

HYGIENIC SUBSTANTIATION OF THE MAXIMUM PERMISSIBLE CONCENTRATION OF TIN TRIBUTYLMETHACRYLATE IN WATER BODIES, (IN RUSSIAN),
Moskovskii Gosudarstvennyi Meditsinskii Institut (I) (USSR).
V. N. Tsai.
Gig Sanit 4, p 42-45, 1975.

Descriptors: *Lethal limit, Public health, *Organic compounds, Toxicity, Rodents, *Pollutant identification, Organic wastes.
Identifiers: *Tin, *Methacrylates.

Tin tributylmethacrylate (TBTM) is highly toxic and has pronounced cumulative properties. Its threshold concentration in rats, judging by its organoleptic index of noxiousness, amounts to 0.064 mg/l, which corresponds to a level of 0.1 mg/l in water bodies. The nontoxic dose of ATTM in a chronic sanitary-toxicologic experiment was 0.00001 mg/kg, which is equivalent to a concentration of 0.0002 mg/l. This concentration is suggested as the maximum permissible one for the substance in water bodies.--Copyright 1976, Biological Abstracts, Inc.

FIELD MONITORING TECHNIQUES AND DATA ANALYSIS,
North Carolina Univ. at Chapel Hill. Dept. of Environmental Sciences and Engineering.
M. D. Sobsey.
Paper presented at Symposium on Virus Aspects of Applying Municipal Wastes to Land, June 28-29, 1976, Univ. of Florida, Gainesville. 10 p, 2 tab, 21 ref. OWRT A-090-NC(1), 14-34-0001-7070.

Descriptors: *Viruses, *Municipal wastes, *Monitoring, Land use, Soil properties, Vegetation, Statistical methods, Statistics, Geology, Hydrology, Water reuse.
Identifiers: *Land application, *Enteric viruses, Data analysis.

Field monitoring for enteric viruses should be planned and conducted on the basis of a rational virus monitoring program. A variety of site-specific factors, including (1) the type of waste; (2) the nature and extent of preapplication treatment; (3) the type of application system; (4) seasonal, climatic and meteorological conditions; (5) geology, hydrology and soil characteristics; (6) the type of vegetative cover and its intended use; and (7) the population and topology of the area should be considered in assessing the nature and extent of possible virus hazards that could be produced by the operation of the land application system. This assessment can be used to determine the type and size of virus samples and the sampling frequency and thereby provides the basis for the design and operation of a virus monitoring program. The data obtained from the virus monitoring program can be analyzed using conventional statistica techniques but these analytical tools should be ap plied with caution because the conditions required for their use may not be consistent with the pattern of virus distribution and movement through the site, especially over a period of time. MOLECULAR ACTIVATION ANALYSIS AND ITS APPLICATION TO METHYLMERCURY DETERMINATION IN VARIOUS MARINE SAMPLES,
Carleton Univ., Ottawa (Ontario). Dept. of Chemistry.
I. G. DeJong, and D. R. Wiles.
Journal of the Fisheries Research Board of Canada, Vol. 33, No. 6, p. 1324-1330, June, 1976. 4 tab., 17 ref.

Descriptors: *Analytical techniques, *Methodology, *Mercury, *Chemical analysis, *Pollutant identification, Laboratory tests, *Neutron activation analysis, Assay, Heavy metals.
Identifiers: *Nuclear activation analysis, *Methylmercury.

A novel method is described by which nuclear activation analysis can be used to determine the chemical form in which certain elements occur. The radiochemical retention of molecular identity is constant for a given type of sample and can be easily determined. Application of this method for quantitative estimation of methylmercury in fish protein concentrates and in blood is described in detail and the results discussed. The results are reliable and reproducible. Radiochemical retention depends on the species of fish, perhaps because of gamma radiolysis of the sample. An alternative method is also described which, although less

ct, is free from many of the common inter-
nces, such as sodium and phosphorous. This
nod, also useful for blood analysis is ap-
riate for use at remote sampling stations.

Identifiers: *Outer Continental Shelf, *Petroleum resources, Oil exploration, Oil development, Oceanographic data, Cyclonic circulation.

Both historical and currently incoming ship-of-opportunity oceanographic data is utilized to examine large-scale circulation and mixing features on the southeastern Bering Sea shelf. Data obtained in the Unimak Pass-Bristol Bay region during summer 1968 were adequate to support existing hypotheses that a cyclonic circulation was occurring in that region. The data suggested in addition that upwelling of deeper water was occurring in central Bristol Bay. The hypothetical cyclonic circulation and attendant upwelling in central Bristol Bay could have significant implications. A contaminant released near or at the bottom could be carried upwards to the surface and incorporated into the food chain there at the primary productivity level. (Vertical mixing might also act to mix bottom contaminants to the surface.) Such biological contamination could result in concentration of undesirable substances at the higher food levels, for example, fish. This is particularly significant because Bristol Bay contains one of the World's major fisheries. (Sinha-OEIS)

A STUDY OF THE SUSPENDED PARTICULATE PROBLEM IN THE DUWAMISH BASIN,
Boeing Co., Seattle, Wash.
R. H. Olsen, M. Y. Almassy, and A. L. Wingert.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-245 154, Price codes: A05 in paper copy, A01 in microfiche. Report EPA 910/9-75-010, May 1975. 81 p, 35 fig, 19 tab, 20 ref, 1 append. EPA 68-02-1499.

Descriptors: *Air pollution, *Surveys, *Washington, *Suspended solids, Dusts, Fly ash, Pollen, Pollutants, Path of pollutants, Winds, Industries, Industrial wastes, Chemical analysis, Particle size, Electron microscopy, Sampling, *Pollutant identification.
Identifiers: *Duwamish Basin(Wash), *Seattle(Wash).

Air quality data accumulated since 1965 indicate that the primary and secondary national air quality standards have been exceeded in the Duwamish Basin area of Seattle, Washington. The objectives of this study were to determine the nature of suspended particulate and, subsequently, to quantify the impact of particulate sources. Ambient and source particulate was collected on fiberglass and membrane filters. Results from gravimetric, elemental, and compound analyses were combined with meteorological data for correlation and analysis. The contribution of sources for the basin was found to be 27% from natural sources, 39% transportation, and 34% point industry and multiple-area sources. Results from this study showed the complexity of suspended particulate. Source tests showed a multitude of elements and compounds present and, to complicate matters, that surrounding soil has been contaminated by industrial and area sources. About 35% of the particulate is directly related to road dust-type emissions. (Sims-ISWS)

COMPUTER MAPPING OF WATER QUALITY IN SAGINAW BAY WITH LANDSAT DIGITAL DATA,
Bendix Aerospace Systems Div., Ann Arbor, Mich.
R. H. Rogers, N. J. Shah, J. B. McKeon, and V. E. Smith.
Available from the National Technical Information Service, Springfield, VA 22161 as N76-16547, Price codes: A02 in paper copy, A01 in microfiche. Report BSR 4213, January 1976. 13 p, 4 fig, 2 tab, 7 ref. NASA NAS5-20942.

Descriptors: *Remote sensing, *Water quality, *Lake Huron, *Satellites(Artificial), *Michigan, Sampling, Surveys, Chemical properties, Biological properties, Chlorides, Conductivity, Nitrogen, Phosphorus, Chlorophyll, Temperature, Turbidity, Data processing, Regression analysis.
Identifiers: *LANDSAT, *Saginaw Bay(Mich).

Computer techniques were developed for mapping water quality parameters from LANDSAT data, using surface samples collected in an ongoing survey of water quality in Saginaw Bay (Lake Huron), Michigan, sponsored by the Environmental Protection Agency. Chemical and biological parameters were measured on 31 July 1975 at 16 bay stations in concert with the LANDSAT overflight. Application of stepwise linear regression to seven of these parameters and corresponding LANDSAT measurements resulted in regression correlation coefficients that varied from 0.94 for temperature to 0.71 for Secchi depth. Chloride, conductivity, total Kjeldahl nitrogen, total phosphorus, and chlorophyll were best correlated with the ratio of LANDSAT Band 4 to Band 5. Temperature and Secchi depth were best correlated to Band 5. Results of the regression analysis were used to map the water quality parameters over the entire bay. (Sims-ISWS)

WATER QUALITY SIMULATION OF TAHOE-TRUCKEE SYSTEM, NEVADA-CALIFORNIA - VOLUME II - APPENDICES,
Nevada Univ., Reno. Center for Water Resources Research.
J. A. Westphal, J. V. A. Sharp, and R. I. Bateman.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-247 799, Price codes: A13 in paper copy, A01 in microfiche. Report EPA-600/2-76-005b, January, 1976. 296 p, 20 fig, 8 tab.

Descriptors: *Water quality, *Simulation analysis, *Model studies, *Rivers, *Tributaries, Surface waters, *California, *Nevada, Inorganic compounds, Bicarbonates, Chlorides, Sulfates, Sodium, Potassium, Calcium, Magnesium, Silica, Solid wastes, Computer models
Identifiers: Tahoe-Truckee system(Calif-Nev).

Documentation for a digital inorganic water quality simulation model of the Tahoe-Truckee System which consists of the mainstem and tributaries of the Truckee River between Tahoe City, California and Nixon, Nevada is presented in the form of appendices. The model is based on the principle of mass-flux balance and presumes that inorganic constituents are conservative, complete mixing occurs instantaneously, and that flows are recapitulated accurately at the defunct gaging station near Truckee, California. The model was developed from 3 yr of water quality data collected monthly at about 40 sites along the mainstem and tributaries. The appendices include: predictive equations, a computer program for the model, cumulative frequency distribution curves, a derivation of complete mixing equations, and simulation model output for bicarbonate, chloride, sulfate, sodium, potassium, calcium, magnesium, silica, and total dissolved solids. PRELIMINARY ASSESSMENT OF SUSPECTED CARCINOGENS IN DRINKING WATER: REPORT TO CONGRESS.
Environmental Protection Agency, Washington, D.C. Office of Toxic Substances.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-250 961, Price codes: A06 in paper copy, A01 in microfiche. Report No. EPA 560/4-75-005, December, 1975. 115 p, 16 tab, 89 ref.

Descriptors: *Potable water, *Water pollution, *Public health, *Water pollution effects, *Pollutant identification, Water purification, Chlorination, Asbestos, Inorganic compounds, Organic compounds, Polychlorinated biphenyls, Polymers, Pesticides, Hydrocarbons, Economics, Water pollution control, Disinfection, Radioactivity.
Identifiers: *Carcinogens, Polyvinyl chloride, Chlorinated hydrocarbons, Trihalomethanes, Chloroform, Nitrosamines.

A compilation of efforts by the Environmental Protection Agency to identify and control suspected carcinogens in drinking water is presented. Topics covered include: studies dealing with the nature and extent of drinking water, including analyses for polychlorinated biphenyls, polyvinyl chloride, nitrosamines, trihalomethanes, pesticides, suspected inorganic carcinogens, asbestos, and radioactivity; evaluations of the risks associated with contaminant levels in drinking water; the identification of drinking water contaminant sources (industrial sources, chlorination, municipal waste treatment discharges, agricultural chemicals); treatment techniques for controlling drinking water contaminants; and projected costs for removing carcinogenic contaminants from drinking water. Byproducts from chlorination (chloroform and other trihalomethanes) appear to be more easily prevented than removed. Two techniques currently being considered for avoiding trihalomethane formation are the use of an alternative to chlorine as the disinfectant and the removal of precursors that react with chlorine. (Kreager-FIRL)
W77-03360

WATER USAGE AND WASTEWATER CHARACTERIZATION AT A CROPS OF ENGINEERS RECREATION AREA,
Army Engineer Waterways Experiment Station, Vicksburg, Miss. Environmental Effects Lab.
N. R. Francingues, Jr, and A. J. Green, Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A02 584. Price codes: A03 in paper copy, A01 in microfiche. Paper No. Y-76-1, January, 1976. 44 p, 7 fig, 10 tab, 5 ref.

Descriptors: *Recreation facilities, *Wastewater(Pollution), *Water requirements, *Water utilization, *Water management(Applied), Ammonia, Nitrogen compounds, On-site investigations, Monitoring, Design criteria, *Pollutant identification.

A field monitoring study to collect information on water usage and waste water characterization at Corps of Engineers recreation area was conducted in order to develop guidelines for assisting Corps of Engineers districts in optimizing the design and operation of recreation area waste water management systems. Water usage and waste water production rates were significantly less than those presently being used by Corps of Engineers districts. The characteristics of the waste water from the camping areas were not substantially different from those for picnic, rest, or other day-use areas (comparable to medium-strength domestic wastewater), except for ammonia nitrogen which was somewhat higher. It appears that the sizing of water supplies and waste water treatment facilities should be based on the number of occupied campsites in overnight areas and not on the number of people. Suggested design values for waste water treatment facilities serving Corps of Engineers recreation areas are tabulated. (Kreager-FIRL)

A REVIEW OF CLUSTERING TECHNIQUES WITH EMPHASIS ON BENTHIC ECOLOGY,
Portland State Univ., Oreg. Urban Studies Center.
J. D. Walker
Available from the National Technical Information Service, Springfield, VA 22161 as PB-241 230. Price codes: A03 in paper copy, A01 in microfiche. Intern Report, EPA Pacific Northwest Environmental Research Laboratory, Newport, Oregon, August 1974. 21 p, 33 ref.

Descriptors: *Numerical analysis, *Benthos, Animal groupings, Plant groupings, Analytical techniques, Pollutant identification, Marine biology, Benthic fauna, Benthic flora.
Identifiers: *Clustering techniques.

The ability of clustering techniques to sort out benthic community types makes them useful for

U. OF I. URBANA-CHAMPAIGN

ecting pollution stresses. This report reviews
hierarchical numerical clustering techniques
detail including benthic studies where these
thods were employed, and briefly considers
-hierarchical strategies. The hierarchical
tegies considered are agglomerative and divi-
e. Agglomerative hierarchies start with the in-
iduals and fuse groups up to the entire popula-
while divisive hierarchies start with the popu-
on and divide it down to the individuals. Ag-
merative strategies seem to have more inherent
blems than divisive, but are more popular in
rine ecology. The main problems with ag-
merative strategies are: (1) the computation
e required for large populations, since the fu-
process must run from the individual to the
re population, and (2) the tendency for minor
classification because the fusion starts at the
ividual level where chance anomalies are more
ly to occur. Most divisive strategies, though
as sensitive to these problems, are based on
nothetic division which requires considerable
ght in order to select the right attribute to di-
e the population into two groups as unlike as
sible. Non-hierarchical strategies do not define
ute between groups but optimize the structure
the group by making it as homogeneous as
sible. However, their current state of develop-
nt lags far behind that of hierarchical systems
they have received little interest in benthic
dies. (Luedtke-Wisconsin)

MUSSEL TEST FOR BIOLOGICAL CONTROL OF WATER POLLUTION (KAGYLO-TESZT VIZSENNYEZESEK BIOLOGIAI HATASANAK VIZSGALATARA),
J. Salanki.
Hidrologiai Kozlong, Vol. 56, No. 6, p 281-282, June, 1976. 3 fig, 5 ref.

Descriptors: *Mussels, *Bioindicators, *Monitoring, *Water pollution, Freshwater fish, Heavy metals, Oxygen, Pollutant identification.

The use of the fresh water mussel (Anodonta cygnea) as a biological indicator of water pollution is proposed. The fresh water mussel is a typical filter-feeding animal and reacts to various substances dissolved in the water by changes in the rhythmic and periodic activity of its adductor muscles. This activity can be monitored by recording the position and movement of the animal's shells which in turn reflect the concentration of pollutants like heavy metals as well as the oxygen level of the water. THE ELECTROLYTIC RESPIROMETER - I. FACTORS AFFECTING OXYGEN UPTAKE MEASUREMENTS,
Iowa State Univ., Ames. Dept. of Civil Engineering.
J. C. Young, and E. R. Baumann.
Water Research, Vol. 10, No. 11, p 1031-1040, 1976. 11 fig, 1 tab, 10 ref.

Descriptors: *Biochemical oxygen demand, *Measurement, *Pollutant identification, *Electrolysis, Oxygen requirements, Equipment, Pressure, Mixing.
Identifiers: *Respirometers, *Oxygen uptake.

A more complete and accurate measurement of the biochemical oxygen demand (BOD) of waste waters can be provided by the electrolytic respirometer. The apparatus has three major parts: a reaction vessel containing the sample and a magnetic stirring bar or other mixing device; an adaptor unit or alkali container with potassium hydroxide or another solution which absorbs metabolically produced carbon dioxide from atmosphere above sample; and a manometer cell containing a weak electrolyte (sulfuric acid or sodium hydroxide) which detects pressure changes and acts as an oxygen generator to maintain a constant partial pressure in the atmosphere of the sample container. The system is simple and provides a continuous oxygen uptake readout. Errors in measurement are usually contributed to the mixing rate and the concentration of oxygen demanding organic material in the sample. Increased mixing or oxygen enrichment of the air contacting the sample can overcome oxygen transfer limitations. Control of barometric pressure in the manometer cell is important since changes will alter oxygen readings. Corrections with this system are easily made. The coefficient of variability was less than 3.5% for samples with an ultimate BOD value between 20 and 500 mg/liter. BOD measurement is more precise with the electrolytic respirometer than with the dilution method. (Collins-FIRL)

MODEL STUDIES IN AQUEOUS CHLORINATION: THE CHLORINATION OF PHENOLS IN DILUTE AQUEOUS SOLUTIONS,
Waterloo Univ. (Ontario). Dept. of Chemistry.
J. G. Smith, S. F. Lee, and A. Netzer.
Water Research, Vol 10, No 11, p 985-990, 1976. 2 fig, 1 tab, 25 ref.

Descriptors: *Chlorination, *Phenols, *Municipal wastes, Water pollution effects, Waste water treatment, Solvent extractions, Chromatography, Water analysis.
Identifiers: Aqueous chlorination.

To further elucidate well known reactions of phenol which, when present as a contaminant of water supplies, can lead to unpleasant taste and odor in the chlorine-treated end product, model studies were performed to determine the end products of chlorination of phenols in aqueous solutions. Phenols tested were 2,4,6-trichlorophenol; 2,3,4,6-tetrachlorophenol; pentachlorophenol; and p-nitrophenol. These were examined at initial pH's of 6.0 and 3.5, the reaction products isolated by solvent extraction, the mixtures separated by column chromatography and the products identified by their spectral properties. It was found that chlorine displaced the nitro group and there was an aromatic substitution to a more highly chlorinated phenol. Phenol was also oxidized to a chlorinated benzoquinone. There was the addition of one mole of chlorine to the phenol to form chlorinated 2,5-cyclohexadienones and the addition of two moles of chlorine or hypochlorous acid to form chlorinated cyclohexenones and/or chlorinated hydroxycyclohexenones. Minor amounts of octachlorocyclohexadiene (from tetra- and pentachloro-phenols) and octachlorodibenzodioxin (from pentachlorophenol) were isolated. It was concluded that chlorination of phenols in dilute aqueous solution can produce highly chlorinated non-phenolic products. (Collins-FIRL)

CYANOPHAGE ANALYSIS AS A BIOLOGICAL POLLUTION INDICATOR-BACTERIAL AND VIRAL,
North Carolina Univ. at Greensboro. Dept. of Biology.
C. T. Smedberg, and R. E. Cannon.
Journal Water Pollution Control Federation, Vol 48, No 10, p 2416-2426, October, 1976. 4 fig, 4 tab, 26 ref.

Descriptors: *Analytical techniques, *Viruses, *Coliforms, *Monitoring, *Sewage treatment, Measurement, Indicators, On-site investigations, Waste water treatment, Performance, Biological treatment, Trickling filters, Chlorination, Screens, Feasibility studies.

The use of the non-pathogenic, blue-green algal virus LPP-1 as an indicator of virus and coliform presence in waste water was investigated during

field studies at a sewage treatment plant. This cyanophage attacks the filamentous, non-blooming blue-green algal genera Lyngbya, Phormidium, and Plectonema and can be used as an inexpensive monitor of virus and coliform removal from waste water. Its natural presence in waste water and its resistance to chlorination make it especially attractive as an indicator of animal viruses. Since the presence of cyanophages in waste water is paralleled by coliform presence, LPP-1 can also be used to detect fecal pollution. Results obtained with this monitoring test are tabulated for composite samples of waste water taken at initial screening points, before and after trickling filtration, and after chlorination. USE OF INTRINSICALLY SAFE INSTRUMENTATION.
Water Services, Vol. 80, No. 964, p 356-357, June, 1976. 2 ref.

Descriptors: *Monitoring, *Analytical techniques, *Sewage treatment, *Explosions, *Gases, Electrical equipment, Design criteria, Safety, Treatment facilities.

Safeguards to prevent flammable gas explosions triggered off by electrically-operated monitoring equipment used within sewage collection networks and at sewage treatment plants are discussed. Monitoring and control equipment is frequently made intrinsically safe by the use of shunt diode barriers which effectively remove the risk of incendive levels of energy breaking through from remotely mounted equipment. The majority of shunt diode barrier applications in the sewage industry are straightforward and include the use of switches, thermocouples, resistance elements, thermometers, and solenoid pilot valves in pneumatic systems. Magnetic flowmeters are made safe by encapsulating the coil and increasing the safety terminal compartment. The probes and detecting circuit are normally made safe by the use of shunt diode safety barriers. (Kreager-FIRL)

MONITORING OF COMMUNITY WATER SUPPLIES,
Ontario Ministry of the Environment, Toronto. Pollution Control Branch.
P. D. Foley, and G. A. Missingham.
American Water Works Association Journal, Vol. 68, No. 2, p 105-111, 6 tab, 11 ref, 1 append.

Descriptors: *Monitoring, *Water supply, *Water quality, Gas chromatography, Mass spectroscopy, Heavy metals, Organic compounds, Potable water, Analytical techniques, Public health, Electron microscopy, *Pollutant identification, *Canada.
Identifiers: *Ontario.

Water quality in Ontario, Canada, was subjected to an in depth monitoring program. New and improved analytical techniques such as the electron-microscope and gas chromatograph-mass spectrometer-computer analysis were used to confirm the presence of various substances at low concentrations in water supplies. Great concern was shown towards substances known to be toxic at great concentrations or carcinogenic. Substances investigated were asbestos, heavy metals, and organics. Resultant analyses indicated that the asbestos in water does not penetrate the gut wall and is not a health hazard. Heavy metals were not seen as a major problem. Their problems consist of particles from lead services or copper piping in the distribution system. High copper levels are controlled by raising the water pH, which lessens the lead problem, though that may require replacement of lead. Organic analysis revealed a great low-level incidence of haloforms. In drinking water, the only organic with an assessable history was found to be chloroform. It was not considered a health hazard. Pesticide and herbicide levels were not considered dangerous. It was finally concluded that the great differences in the orders-of-magnitude in doses and concentrations prevent any definite conclusions. (Collins-FIRL)
W77-03463

INVESTIGATIONS ON THE IMPORTANCE OF THE ORGANIC CHLORO-COMPOUNDS AND THEIR ADSORBABILITY (UNTERSUCHUNGEN ZUR BEDEUTUNG DER ORGANISCHEN CHLORVERBINDUNGEN UND IHRER ADSORBIERBARKEIT),
W. Kuehn, and F. Fuchs.
Vom Wasser, Vol. 45, p 217-232, 1975. 8 tab, 25 ref.

Descriptors: *Pollutant identification, *Analytical techniques, *Treatment facilities, *Organic compounds, *Chlorine, Adsorption, *Water treatment, Chlorination, Dewatering, Incineration, Activated carbon.
Identifiers: Pyrohydrolysis.

Pyrohydrolysis, used to analytically determine organic chloro-compounds, also shows interesting results for controlling water treatment plants for the concentration in water of these compounds. Results for DMF-extract, dioxane extract, non-polar organic chlorine and total organic chlorine in activated carbon samples from water works are given. Values for Lake Constance, the Rhine, and several other rivers were measured, and these substances' origins are discussed. More highly activated carbon is more selective for organic chlorine than lower activated carbon. (Snyder-FIRL)
W77-03465

A NEW METHOD OF AUTOMATIC DETERMINATION OF NITRATE IN WASTE WATERS AND POLLUTED SURFACE WATERS (EIN NEUES VERFAHREN ZUR AUTOMATISCHEN NITRAT-BESTIMMUNG IN ABWAESSERN UND BELASTETEN OBERFLAECHENWAESSERN),
R. Wagner, I. Frommert, and R. Koenig.
Vom Wasser, Vol. 45, p 271-284, 1975. 9 fig, 18 ref.

Descriptors: Surface waters, *Pollutant identification, *Sewerage, *Analytical techniques, *Automation, *Nitrates, Waste water(Pollution), Effluents, Ions, Water pollution, Instrumentation.
Identifiers: Receiving streams, P-fluoro phenol method.

For manual nitrate determination in sewage, plant effluents, and receiving streams, the p-fluoro phenol method is very successful. Nitrate ions form 2-nitro-4-fluoro phenol in a nitration step included in the method. The 2-nitro-4-fluorophenol is transferred to an alkaline recipient by steam distillation, producing a yellow solution for spectrophotometric measurement. An AutoAnalyzer system, including distillation with a new pass through unit to heat the sample stream, based on a boiling thermostat, which is located in front of the distillation head, was prepared for automatic performance of the p-fluoro phenol method. The manifold is adapted for between about 0.1 and 30 ppm nitrate nitrogen; the sample frequency is 10 per hour. This automatic method may also be used in cases in which methods based on partial nitrate ion reduction to nitrite ions, due to irregular reduction rates, do not give reliable results. (Snyder-FIRL)

NITRATE MONITORING.
Water Services, Vol. 80, No. 964, p 357-358, June 1976. 1 fig.

Descriptors: *Nitrogen, *Waste water treatment *Sewage treatment, *Pollutant identification *Analytical techniques, *Treatment facilities *Nitrates, Monitoring, Sewerage, Potable wate Water quality standards.

The World Health Organization has fixed a lim for nitrate in potable water of 11.3 mg/liter nitrat as nitrogen. One major source of nitrate is sewag effluent, since nitrates are derived from ammon um compounds during secondary treatment in no mal aeration plants and conventional sewage trea ment has little effect on nitrate levels. Ion-selec tive electrode analysis for nitrate measuremen has a wide range of applications and is compara tively unaffected by strong or highly colored sol tions and suspended solids but requires frequen standardization and constant temperature contr or compensation. Continuous monitoring is esse tial to prevent undetected gross pollution, and suitable continuous monitor designed for on-lin analysis has been developed. Measurement made by a preset expanded scale pH amplifie The sample is drawn from a constant head uni through a heat exchanger and then pumped past mixing cell fitted with the nitrate and referenc electrodes. The first major use of this monitor fo nitrate was northeast of London on the River Le which carries a high sewage effluent loading. Th River Lee is also monitored for pH, temperatur dissolved oxygen, conductivity, suspended solid and ammonia. Nitrate monitoring was added to th network in 1973. Nitrate has been shown to be us ful for assessing pollution loading and denitrifica tion. (Snyder-FIRL)

niques, *Aerial photography, Color, Algae,
llutant identification, *Remote sensing.

ew technique of analyzing aerial photography
applied to the study of eutrophication in lakes.
progression of eutrophication in lakes is ac-
panied by a change in water color from blue to
n. The higher the concentration of algae, the
ner the water color. One problem involved
whether satellite or aircraft should be used in
photography. Aerial photography has the ad-
tage of being able to sample an entire lake in
utes or hours, rather than in days as with sur-
craft. New processing procedures allow so-
ticated color separation which can be analyzed
etermine areas where eutrophication is either
nning or increasing. Corrections may be made
atmospheric conditions which might interfere
photo interpretation. This process is being im-
ed and can provide immense detailed informa-
to scientists who must deal with this problem.

*Bacteriophage.
ntifiers: *Coliphage.

udy was undertaken to determine whether the
of fecal coliform bacteria to total coliphage in
sewage, sewage lagoon effluent, or river
er, had any significance as a pollution index.
al coliform populations were determined using
most probable number technique. Total
hage populations were determined using
herichia coli B host cells. The ratios of fecal
orms to coliphage were 87:1, 4.2:1, and 0.15:1,
ectively. The ratio of fecal coliforms to
hage in stored raw sewage decreased to about
within 7 days at 20C and within 28 days at 4C.
changes resulted from the greater longevity of
coliphage. The ratio of fecal coliforms to
hage is not considered a reliable index of
l pollution because it is influenced by prior
amination, presence of sediment, chlorina-
and temperature. (Snyder-FIRL)

ID DETECTION OF BACTERIAL EN-
TOXINS IN DRINKING WATER AND
OVATED WASTE WATER,
is Univ. Health Science Center at San An-
. Dept. of Pathology.
Jorgensen, J. C. Lee, and H. R. Pahren.
lied and Environmental Microbiology, Vol.
No. 3, p 347-351, September, 1976. 2 tab, 17

Descriptors: *Pollutant identification, *Analytical techniques, *Toxins, *Pathogenic bacteria, *Potable water, *Reclaimed water, Waste water(Pollution), Tertiary treatment.
Identifiers: *Endotoxins, *Limulus assay.

Experiments were conducted to determine the applicability of using the Limulus assay to measure endotoxins in potable waters and highly treated waste waters. Twenty-five samples of drinking water and Advanced Waste Treatment (AWT) process samples from around the United States were tested. The Limulus test was easily adapted to water testing without modification of the assay procedure. This investigation showed that this method could be used to test water samples for pyrogenic substances, i.e., gram-negative bacterial endotoxins. It was proven simple, relatively inexpensive, sensitive, and reliable. Other advantages determined were rapidity (total test time of less than 2 hr), no need for specialized equipment or facilities for maintaining lab animals, and it can be performed with little difficulty in any microbiology laboratory after short specialized instruction. (Collins-FIRL)

TRANSFERABLE DRUG RESISTANCE ASSOCIATED WITH COLIFORMS ISOLATED FROM HOSPITAL AND DOMESTIC SEWAGE,
Florida Univ., Gainesville. Dept. of Environmental Engineering Sciences.
T. D. Fontaine, III, and A. W. Hoadley.
Health Laboratory Science, Vol. 13, No. 4, p 238-245, October, 1976. 1 fig, 4 tab, 20 ref.

Descriptors: *Waste water treatment, *Sewage treatment, *Sewerage, *Pollutant identification, Treatment facilities, Resistance, Coliforms, Hospitals.
Identifiers: Drug resistance, Hospital wastes.

A study was performed to determine the extent to which hospital wastes may serve as reservoirs for the spread of antibiotic-resistant fecal coliforms and their associated risk transfer factors in the environment. Samples of hospital, campus, and combined waste streams entering the University of Florida treatment plant were collected, as well as samples of treated effluent before chlorination and polishing pond effluent. Of 41 bacterial strains isolated from hospital wastes, 90.2% were resistant to at least one antibiotic, in contrast to 55.5% of 54 isolates from campus wastes. The proportion of resistant strains able to transfer resistance varied from 50% to 90%, depending on season and source. Transfer of as many as seven resistance determinants was demonstrated under the usual laboratory conditions. Populations of fecal coliforms were reduced by slightly more than 90% by treatment prior to chlorination, but the proportions of isolates resistant to one or more antibiotics and able to transfer resistance did not change appreciably. The proportion of multiple resistant strains isolated from hospital wastes was twice that observed in campus wastes, and remained approximately constant through the treatment plant. The emergence of a population of Salmonella choleraesuis resistant to tetracycline in a laboratory of simulation of waste treatment processes provided preliminary evidence that resistance transfer may occur in sewage. AEROSOL PRODUCTION BY IRRIGATION EQUIPMENT USED FOR LAND APPLICATION OF WASTE WATER,
Brookhaven National Lab., Upton, N. Y.
G. S. Raynor, and J. V. Hayes.
American Industrial Hygiene Association Journal, Vol. 37, No. 9, p 526-536, September, 1976. 9 fig, 4 tab, 8 ref.

Descriptors: *Pollutant identification, *Sewerage, *Aerosols, *Irrigation practices, *Irrigation systems, Application equipment, Land use, Waste water(Pollution), Water reuse.

Experiments were conducted to determine the size distribution and concentration of aerosols and drops from dilute untreated sewage sprayed through agricultural irrigation systems. Experiments were conducted at specified pressures for each nozzle system over a wide range of wind speed, temperature, and relative humidity. Output rate, flow rate through each sampler and meteorological conditions were measured during testing. Testing was done with four nozzle systems used for upland recharge of waste water. A small part of the liquid output was lost to drift droplets, but large quantities of small aerosols were produced, especially in the respirable size range. The typical system produced from 10 to the 13th power to 10 to the 14th power particles per spray acre with a rate of 50,000 gallons per acre per day. Fewer aerosols were produced at low wind speeds from low spraying nozzles. A shorter operating time and exposure to wind may result in fewer aerosols at greater flow rates if fixed amounts of liquids must be emitted. Under typical atmospheric conditions, centerline concentrations decrease from one to two orders of magnitude in a travel distance of 1 km near ground level. (Collins-FIRL)

DETERMINATION OF MAXIMUM PERMISSIBLE LEVELS OF SELECTED CHEMICALS THAT EXERT TOXIC EFFECTS ON PLANTS OF ECONOMIC IMPORTANCE IN ILLINOIS,
Southern Illinois Univ., Carbondale.
J. H. Yopp, W. E. Schmid, and R. W. Holst.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-237 654, Price codes: A12 in paper copy, A01 in microfiche. Illinois Institute for Environmental Quality, Chicago, Report No 74-33, August 1974. 272 p, 27 tab, 525 ref.

Descriptors: *Phytotoxicity, *Chemicals, *Trace elements, *Air pollution effects, *Agronomic crops, *Horticultural crops, *Vegetable crops, *Soil contamination effects, *Illinois, Standards, Aluminum, Cadmium, Chlorine, Chromium, Copper, Fluorine, Lead, Manganese, Mercury, Molybdenum, Nickel, Nitrogen compounds, Nitrates, Ozone, Sodium, Sulfur, Resistance, Public health, Sulfates, Sulfides, Zinc, Forests, Water quality standards.
Identifiers: Barium, Beryllium, Boron, Ethylene, Bromide, Nitrogen dioxide, Peroxyacetyl nitrate, Selenium, Sulfur dioxide, Hydrogen sulfide, Thallium, Vanadium.

Based on comprehensive literature surveys, maximum permissible levels are proposed for aluminum, barium, beryllium, boron, bromide, cadmium, carbon-ethylene, chlorine, chromium, copper, fluorine, lead, manganese, mercury, molybdenum, nickel, nitrogen dioxide, peroxyacetyl nitrate, ammonia, nitrate, ozone, selenium, sodium, sulfur dioxide, sulfate, hydrogen sulfide, thallium, vanadium, and zinc in Illinois soils and air to avoid phytotoxicity of agronomic, horticultural, and vegetable crops, and conifers. The phytotoxic levels were generally selected on the basis of the most sensitive species, but the

response of each plant varied with environmental factors, genotype, variety of the same species, growth stage, and nutritional status. Data of the degree of sensitivity (or tolerance) of economically important plants allows selection of species for culture which are adapted to the Illinois environmental and economic conditions. The symptomology of the various trace metals and oxides is discussed for specific plant types, as are the sources of the chemicals, and the biochemical responses. The absence of controlled studies on uptake of airborne particulates of these trace metals prevented any recommendations concerning permissible levels of these agents as air pollutants. The phytotoxicity of each element is discussed in a separate chapter, with tables ranking plants according to their economic importance and sensitivity. The maximum permissible levels are given for both airborne and soil forms of each element. (Auen-Wisconsin)

NATURE PRESERVATION ACTIVITY RR INVESTIGATION: PART 6. A MODIFIED METHOD OF MEASURING THE CHEMICAL OXYGEN DEMAND GIVES A HIGH ANALYTICAL CAPACITY, (IN SWEDISH),
Uppsala Kommun Naturvardsverkets RR-Undersokning (Sweden). Algestlab. Fysiol. Bot.
A. Forsberg, and S-O. Ryding.
Vatten 31(2), p 148-154, 1975.

Descriptors: *Sampling, *Water analysis, *Methodology, *Water treatment, *Water purification, Autoclaves, Oxidation, Mercury, Chlorine, Potassium, Manganese, Ions, Pollutant identification.
Identifiers: Recipient examination, Reagent volume, Dichromate concentration.

For a water control program based on frequent sampling, a simplified chemical O2 demand (COD) measurement method, the purification plant recipient examination (RR) method, was developed. The procedure includes small sample and reagent volume, rapid addition of a mixture of all reagents to the sample, exclusion of Hg, and autoclaving at 120C for 1 h. The yield by the RR-method was about 10% lower than that by the standard method, mostly due to decreased dichromate concentration and oxidation temperature. Correction For Cl- interference is unnecessary below 1 g Cl-/l; Hg addition has a significant influence on the results only in water samples with a higher Cl-concentration. The RR-method showed a good correlation to the values for KMnO4 consumption. A large number of water samples can be preserved by deep-freezing and analyzed quickly later on.

SURF-ZONE WATER QUALITY IN LIVERPOOL BAY,
Lancaster Univ., Bailrigg (England). Lancashire and Western Sea Fisheries Joint Committee.
P. R. Hinchcliffe.
Estuarine and Coastal Marine Science, Vol. 4, No. 4, p 427-442, July 1976. 9 fig, 1 tab, 21 ref.

Descriptors: *Water quality, *Surf, *Bays, *Nutrients, *Eutrophication, Coasts, Shores, Estuaries, Phosphorus, Phosphates, Nitrogen compounds, Nitrites, Nitrates, Ammonia, Salinity, Coliforms, Hydrogen ion concentration, Suspended solids, Seasonal, Monthly, Foreign countries.
Identifiers: *Liverpool Bay, *Surf-zone, *Lancashire, *Mersey River.

Results of a continuing investigation of seasonal and long-term changes in surf zone water quality in Liverpool Bay were reported for the period 1971-1974. A total of thirteen sites was sampled at monthly intervals for all or part of that period. Of the sample constituents analyzed, salinity, pH, ammonia, and nitrite-nitrate demonstrated fairly predictable seasonal patterns. Dissolved oxygen remained near saturation level throughout. Dissolved reactive phosphate was buffered by large amounts of suspended matter and showed little seasonal variation. Coliform levels were higher in winter than summer, suggesting that increasing temperature produces higher die-off rates. The Mersey appeared to exert strong influence on the salinity and the concentrations of inorganic nitrogen and phosphorus on Liverpool Bay. Both phosphate and nitrate showed significant tendencies to increase over the four-year period. If these increases continue, excessive eutrophication of the bay seems probable in the near future. Monthly sampling at five Lancashire coastal sites is intended to continue indefinitely. (Bender-ISWS)

RELATION BETWEEN ATMOSPHERIC POLLUTION, PRECIPITATION, AND STREAMWATER QUALITY NEAR A LARGE URBAN-INDUSTRIAL COMPLEX,
Illinois State Water Survey, Urbana.
F. A. Huff.
Water Research, Vol. 10, No. 11, p945-953, 1976. 3 fig, 7 tab, 12 ref. NSF GK-38329.

Descriptors: *Pollution, *Streamflow, *Urban runoff, *Missouri, *Air pollution, Water pollution, Chemicals, Chemical analysis, Sampling, Rainfall, *Precipitation(Atmospheric), Runoff, Fallout, Correlation analysis, Pollutants, Path of pollutants.
Identifiers: *St. Louis(Mo).

An investigation was made of the effects of atmospheric effluents from a large urban-industrial area (St. Louis) on the water quality in two small basins that are frequently downwind of the city. Analyses were made of the relative magnitude of the atmospheric contribution to streamwater pollution and how this contribution is related to weather conditions. Field sampling was done during a 15-month period, and investigation was made of atmospheric-streamwater relationships for storm, seasonal, and annual periods. Computations were made for 12 chemical constituents in the rainwater and streamwater. Results indicated that only minor changes usually occur in streamwater pollutant concentrations during and shortly following storms. Also, no strong relationship exists between streamwater concentration and weather conditions. For most pollutants, the atmospheric deposition was small compared with the annual stream load because of major surface sources. However, evidence was also found that urban-industrial sources can occasionally be important contributors to stream contamination. (Sims-ISWS)

OPTRM - A HYDROLOGIC TRANSPORT MODEL WITH PARAMETER OPTIMIZATION,
Oak Ridge National Lab. Tenn.
D. E. Fields, and S. B. Watson.
Report ORNL-NSF-EATC-14, September 1975. 131 p, 8 fig, 5 tab, 28 ref, 9 append. NSF W-7405-eng-26.

Descriptors: *Model studies, *Runoff, *Watersheds(Basins), *Path of pollutants, Computer models, Mathematical models, Computer programs, Tracers, *Optimization, Streamflow, Hydrologic systems, Water transfer, Water pollution, Hydrology.
Identifiers: *Hydrologic transport models.

A version of the Wisconsin Hydrologic Transport Model which incorporates a procedure for obtaining an optimal set of model parameters was implemented. An optimal set of parameters was defined to be that set which is derived by minimization of an objective function which quantifies the dissimilarity between observed and simulated hydrologic flow or contaminant transport values. Function minimization on either a monthly or daily basis was performed by a pattern search technique. A discussion of the OPtimized TRansport Model-(OPTRM) was followed by a user's guide to the model. Also included were simulations of Walker Branch Watershed in which selected sets of hydrologic and potassium transport-related parameters are determined. The appendixes contained listings of the computer programs used. (Sims-ISWS)

PERMISSIBLE LEVEL OF BENZO(A)PLYRENE IN WATER BODIES, (IN RUSSIAN),
Institut Eksperimentalnoi i Klinicheskoi Onkologii, Moscow (USSR).
A. P. Il'Nitskii.
Gig Sanit 3, p 100-104, 1975.

Descriptors: *Lethal limit, Data collection, *Toxicity, Water pollution, Rodents, Organic compounds.
Identifiers: Carcinogens, *Benzopyrene.

Two series of experiments were carried out to obtain basic data necessary for determining the permissible level of benzo(a)pyrene (BP) in water bodies. In the 1st series the effect of various doses of BP and its combinations with other polycyclic aromatic hydrocarbons was studied after oral administration to 2 strains of mice. In the 2nd series the effect of combined oral and intratracheal BP administration to random-bred rats was studied

data is analyzed in relation to possible ex-olation to humans.--Copyright 1976, Biological tracts, Inc.

MPORAL VARIATIONS IN TRIBUTARY OSPHORUS LOADS,
gers - The State Univ., New Brunswick, N. J.
Tuffey, and F. B. Trama.
'Urbanization and Water Quality Control,' pple, W. Jr. (ed.), American Water Resources ociation, Proc. No. 20, June 1975, p 140-152. 7 8 ref. OWRT A-047-N.J.(1), 14-34-0001-7064.

criptors: Water quality, Water pollution rces, Nutrients, *Phosphorus, Phosphates.
tifiers: *Nonpoint source pollution, Storm nt pollution loadings, Temporal variations.

l tributary phosphorus loading can be dif-ntiated into that occurring during periods of flow steady state and minor rainfalls and that rring at high flow steady states (e.g., in the ng) and during major storms. During low flow ditions, relatively small loads are involved that probably adequately represented in the availa-data base. During high flow conditions induced torm events or seasonal patterns, major incre-ts in phsophorus load occur. A single storm nt contributed in a six-hour time period a TP that is the equivalent of a 30-day low flow dy state loading. Storm-induced phosphorus es can significantly contribute to the annual oad for other than urban watersheds. It is ex-ed that this effect would be even greater in n watersheds. Further studies are needed to ne the characteristics and sampling frequency essary to obtain a statistically reliable data for determining phosphorus loads trans-ed by tributary streams to receiving bodies of er.

E TRANSPORT OF POLLUTANTS IN OUND WATER, (IN GERMAN),
fornia Univ., Riverside. Dept. of Soil Science Agricultural Engineering.
Fluehler.
g Anst Anst Forstl Versuchswes Mitt 51(1), p 266, 1975.

Descriptors: *Path of pollutants, *Groundwater, Soils, Erosion, Water pollution sources, Sorption.

Transport, sorption and breakdown processes have greatly different effects on the erosion of various substances. The interrelationships between the substance transported, the soil and the ground water are very complex and must be simplified for a quantitative description. Established rules can be used only if the insignificant factors can be determined and eliminated. Possible simplifications and evaluation methods for substance transport in natural soils are discussed.--Copyright 1976, Biological Abstracts, Inc.

APPLICATION OF A MODEL FOR LAYOUT AND DESIGN OF SEWER SYSTEMS,
Illinois Univ. at Urbana-Champaign. Dept. of Civil Engineering.
L. W. Mays, H. G. Wenzel, Jr., and J. Liebman.
Paper presented at the 1976 Spring Annual Meeting of the American Geophysical Union, Washington, D.C., April 13-15, 1976. 10 p, 7 fig, 7 ref. OWRT C-4123(No. 9023)(6).

Descriptors: *Optimization, Urban drainage, Environmental engineering, Dynamic programming, Hydraulics, *Model studies, *Storm drains, *Design.
Identifiers: Urban development, Computer applications, Economic analysis.

An optimization model has been developed for the minimum cost layout and design of storm sewer systems. This model can be used to determine the optimal layout, size, and crown elevations of the sewer pipes and depths of the manholes. The optimization is achieved by using a screening model consisting of two conjunctive phases: a model for the combined layout and design and a supplementary design model for prescribed layouts. The combined layout and design model is an optimization procedure based upon discrete differential dynamic programming (DDDP) which simultaneously varies both the system layout and pipe design. Isonodal lines, which are imaginary lines separating manholes for investigation of possible pipe connections, are used to divide the system into stages for optimization. At each stage of the DDDP procedure, a connectivity model, which is formulated as a set-partitioning problem, is solved to determine the minimum cost layout for that stage. The combined layout and design model is an iterative stage by stage procedure resulting in a complete system layout and design after each iteration. When changes in the system layout occur for successive iterations of the combined model, the design model for given layouts is used to compute the optimal design of the previously generated layout by the combined layout and design model. The design model is also an iterative stage-by-stage optimization procedure based upon DDDP. The hydraulics of flow are accounted by using Manning's equation and peak flows at various manholes are added to compute flowrates for the connecting downstream pipes.

THE PHOSPHORUS POLLUTION OF WATERS DUE TO AGRICULTURE, (IN GERMAN),
Eidgenoessische Forschungsanstalt fuer Agrikulturchemie, Bern.
O. J. Furrer.
Eidg Anst Anst Forstl Versuchswes Mitt 51(1), p 267-283, 1975.

Descriptors: *Phosphorus, *Agricultural runoff, Water pollution sources, Agriculture, Fertilizers, Soil erosion, Path of pollutant.
Identifiers: *Switzerland.

Lysimetric studies and investigation on drainage, rain and surface water, and soil profiles were carried out. No danger of fertilizer phosphate erosion exists because it settles in the uppermost layers. This increases the washing away of surface phosphate; measures are suggested for inhibiting this. Agriculture causes less than 10% of the phosphate water pollution in Switzerland. Studies reporting the sources of phosphate pollution in Switzerland are reviewed.--Copyright 1976, Biological Abstracts, Inc.

THE RELATIONSHIP OF BOTTOM SEDIMENTS TO BACTERIAL WATER QUALITY IN A RECREATIONAL SWIMMING AREA,
Arizona Univ., Tucson. School of Renewable Natural Resources.
S. A. Winslow.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-262 259, Price codes: A04 in paper copy, A01 in microfiche. Master of Science, Thesis, 1976. 60 p, 10 fig, 3 tab, 31 ref. OWRT A-053-ARIZ(4). 14-34-0001-6003.

Descriptors: *Water quality, Recreation, *Arizona, Swimming, Water sports, Coliforms, *Bottom sediments, Lake sediments, *Bacteria, Water pollution sources, Pollutant identification.
Identifiers: *Recreational waters, *Bacteriological pollutions, Central Arizona, *Canyon Lake(Ariz).

A study was conducted at Acacia Beach, Canyon Lake, Arizona, to clarify the influence of sediment-stored fecal bacteria on swimming area water quality. An additional goal was to determine the value and potential applications of fecal coliform analyses of bottom sediments for use in sanitary evaluations of natural swimming areas. Concentrations of fecal coliform in sediment were found to be significantly higher during the swimming season than during the nonswimming season. Analyses frequently found large, unpredictable changes in sedimentary fecal coliform concentrations over short time periods. Fecal coliform concentrations in nearshore sediment at Acacia Beach are apparently strongly influenced by currents, wave action and sediment agitation by bathers. Methods of analysis used in this study were not able to quantitatively determine the influence of sediment-stored bacteria on the overlying water at Acacia Beach. Use of fecal coliform analyses of bottom sediments as a stable index of overlying water quality or as a predictive device cannot be made from information collected in this study. However, sediment sampling to supplement routine water sampling is recommended to provide a more complete indication of the total sanitary condition of natural swimming areas.

CALIBRATION OF A THERMAL ENRICHMENT MODEL FOR SHALLOW, BARRICADED ESTUARIES,
University of South Florida, St. Petersburg. Dept. of Marine Science.
K. L. Carder, S. L. Palmer, B. A. Rodgers, and P. J. Behrens.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-262 218, Price codes: A04 in paper copy, A01 in microfiche. Completion Report, September 1976. 61 p, 18 fig, 4 tab, 23 ref, 2 append. OWRT-5083 (4232) (1).

Descriptors: *Thermal pollution, *Model studies, *Computer models, Diffusion, Friction, Calibration, Measurements, *Florida, Thermal power, Heat exchange, *Estuaries, Path of pollutants, Water temperature, Distribution, Dispersion.
Identifiers: Barricaded estuary, Barotropic flow.

A new, semi-implicit, numerical model of thermal dispersion has been developed. It has been linked to an explicit, tidally driven hydraulics model of a barricaded estuary on the west coast of Florida. The model has been used to predict the distribution of temperature resulting from a seawater-cooled power generation facility near Crystal River, Florida. Manning numbers and diffusion coefficients have been determined for the modeled basin and verified by comparing characteristics of the calculated plume to those of the actual plume. Input variables included tidal height, power plant load, solar irradiance, air temperature, humidity, and pressure, and wind speed and direction. After five days of simulation for the period 6/15/75 to 6/19/75, the calculated plume area was within 15% of the measured acreage, and the calculated mean plume temperature differed from the measured value by only 0.05C.

IMMEDIATE INDUSTRIAL EFFECTS ON SEDIMENT MERCURY CONCENTRATIONS IN A CLEAN COASTAL ENVIRONMENT,
Florida State Univ., Tallhassee. Dept. of Oceanography.
G. A. Knauer.
Marine Pollution Bulletin, Vol. 7, No. 6, June 1976, p. 112-115, 3 tab, 1 fig, 14 ref.

Descriptors: *Mercury, *Heavy metals, Sediments, Mineral industry, *Nickel, Water quality, *Australia, *Water pollution, *Bottom sediments, Industrial wastes, *Water pollution sources, Industrial wastes.
Identifiers: *Sediment mercury concentrations, *Nickel refinery, Halifax Bay(Australia), Mercury content, Surface sediment concentration, Subsurface samples.

Studies were initiated in May 1975 to determine the impact of a new nickel refinery on ambient mercury level in sediments taken from Halifax Bay, Australia. Although mercury levels were relatively low in all samples, surface sediments were found to contain 2.5-3.0 times the mercury concentration of subsurface samples. However, surface sediment samples collected adjacent to the refinery outfall within the first three weeks of continuous discharge showed significant increases in mercury levels when compared with surface samples taken from areas not affected by the refinery. PELAGIC TAR IN THE NORWEGIAN COASTAL CURRENT,
Institute of Marine Research, Bergen (Norway).
G. B. Smith.
Marine Pollution Bulletin, Vol. 7, No. 4, April 1976, p. 70-72, 1 fig, 9 ref.

Descriptors: *Oil, *Oil spills, Oily water, Atlantic Ocean, *Path of pollutants, Ocean currents, Drifting(Aquatic) Water circulation, Transportation, Solid wastes, *Periphyton, *Oil wastes, *Plankton.
Identifiers: Gulf steam, Norwegian Coastal Current, *Pelagic tar, Norwegian Coast, Skagerrak, Barents Sea, North Sea, *Norway.

Petroleum particulates were found in 117 of 220 neuston samples collected in the Norwegian Coastal Current during March-August 1975, at an average concentration of 0.11 mg/m2. Highest concentrations were observed in the Skagerrak and Barents Sea. Lower densities occurred along the northwest Norwegian coast and in the North Sea. (Katz)
W77-03190

DISTRIBUTION AND SOURCE OF TAR ON THE PACIFIC OCEAN,
Department of the Environment, Victoria (British Columbia). Ocean Chemistry Div.
C. S. Wong, D. R. Green, and W. J. Cretney.
Marine Pollution Bulletin, Vol. 7, No. 6, June 1976, p. 102-105, 2 tab, 3 fig, 13 ref.

Descriptors: *Oil, Oil spills, Oily water, *Pacific Ocean, *Path of pollutants, *Ocean currents, Drifting(Aquatic), Water circulation, Transportation, *Ships, Water pollution, Solid wastes.
Identifiers: *Tar lumps, Northwest Pacific Ocean, Kuroshio current, Tanker tank washing.

Petroleum residues, or tar lumps, are concentrated in the northwestern portion of the Pacific Ocean, particularly in the Kuroshio current system. The source of the tar appears to be tank washings from tankers on the very large Middle East to Japan route. Tar pollutants apparently are discharged by tankers south of Japan, become entrained in the Kuroshio current, and create a plume of contamination which extends downstream for 7000 km across the Pacific. (Katz)

HEAVY METALS IN LAKES OF THE COEUR D'ALENE RIVER VALLEY, IDAHO,
Idaho Univ., Moscow. Dept. of Zoology.
S. B. Bauer.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-262 388, Price codes: A04 in paper copy, A01 in microfiche. Idaho Water Resources Research Institute, Moscow, November 1974. 55 p, 10 fig, 13 tab, 42 ref. (M.S. Thesis). OWRT C-4145(No. 9060)(1).

Descriptors: *Heavy metals, *Trace elements, *Mining wastes, *Idaho, Lakes, Lake sediments, Zinc, Copper, Cadmium, Lead, Antimony, Spectrophotmetry, Bass, Bullheads.
Identifiers: Coeur d'Alene Lake, Spokane River, Coeur d'Alene River, Swan Lake, Blue Lake, Thompson Lake, Killarney Lake, Anderson Lake, Black Lake, Medicine Lake, Cave Lake, Rose Lake, Bells Lake, Cesium.

Heavy metal concentrations were measured in the water, sediments, and fish of nine small lakes located along the main stem of the Coeur d'Alene River. Mining wastes have been discharged into this drainage since the 1890's. Concentrations of dissolved metals were low in the lakes and did not differ significantly from lake to lake. Zn, Cu, Cd, Pb, Cs and Sb have accumulated in lake sediments. The concentrations of these metals varied in sediments from lake to lake, and within each lake were highest at stations close to the river. Zn, Cu, and Cd concentrations in muscle and liver of Yellow Perch were not signigicantly different between lakes. However, Zn and Cd concentrations in fish from several of the Coeur d'Alene lakes were significantly higher than in fish from a control area. Metal concentrations were somewhat related to trophic status, decreasing at higher trophic levels. Zn, Cu, and Cd concentrations were greater in benthic insects than in fish. The concentration of zinc in muscle was highest in Brown Bullheads (68 mg/kg), an omnivorous species, and lowest in Largemouth Bass (20 mg/kg), a piscivorous species.

DISTRIBUTION OF LIGHT HYDROCARBONS C1-C14, IN THE NORTHEAST GULF O ALASKA AND THE SOUTHEASTERN BERIN SHELF,
National Oceanic and Atmospheric Administr tion, Seattle, Wash. Pacific Marine Environment Lab.
J. Cline, and R. Feely.
In: Environmental Assessment of the Alaska Continental Shelf. Principal Investigator's Repor for the Year Ending March 1976, Vol 9. Chemist and Microbiology, p 443-550, April 1976. 26 fig, tab, 24 ref, 2 append.

Descriptors: *Alaska, *Seepage, *Oil spills, *O pollution, *Water quality, *Water pollution e fects, *Baseline studies, *Environmental effect Sediments, Organic compounds, Path of poll tants, Distribution.
Identifiers: *Outer Continental Shelf, *Beri Sea, Oil exploration, Oil development, *Biogen sources, *Gulf of Alaska, Petroleum resource Crude oils, Lease areas.

The low molecular weight hydrocarbon progra was initiated in the OCS of Alaska in response the environmental guidelines set forth in the E vironmental Study Plan for the Gulf of Alask Southeastern Bering Sea and the Beaufort Sea The purpose was to establish the spatial and te poral variations (seasonal and diurnal) in the d solved hydrocarbon fraction composed methane, ethane, ethylene, propane, propyle isobutane and n-butane. These data are being c lected in order to establish baseline levels of na rally-occurring hydrocarbons in the lease are prior to exploration, development, and producti of fossil fuel reserves. These components ha proven to be valuable indicators of petroleu input arising from drilling, production, and tra portation of crude oil and refined products. In su port of the basic objectives, attention is be given to natural hydrocarbon sources, namely g and oil seeps, production of hydrocarbons fr near-surface sediments, and biogenic sourc within the euphotic zone. NATURAL DISTRIBUTION OF TRACE HEA METALS AND ENVIRONMENTA BACKGROUND IN THREE ALASKA SHE AREAS,
Alaska Univ., College. Inst. of Marine Science.
D. C. Burrell.
In: Environmental Assessment of the Alask Continental Shelf. Principal Investigators' Repo for the Year Ending March 1976, Vol 10. Chem try and Microbiology, p 1-145, April 1976. 16 f 38 tab, 57 ref. 03-5-022-56.

Descriptors: *Alaska, Pollutants, *Water quali *Heavy metals, *Trace elements, *Resour development, Water pollution sources, *Basel studies, Sediments, Chemical analysis, *Path pollutants, Distribution.
Identifiers: *Outer Continental Shelf, Oil explo tion, Oil development, *Petroleum resources, G of Alaska, Bering Sea, Beaufort Sea, Crude oils

Baseline sample collection of water and sedim for the Gulf of Alaska and Bering Sea has be completed and some biota samples taken fr these regions have also been received. Archiv sediment samples from the Beaufort Sea ha been analyzed, and a number of granulometric a clay mineralogy data for the surface sedim from all regions are included in this report. T contents of trace metals analyzed to date in water show no anomolous trends and are as l (or lower) as in other reported data sets for op ocean, uncontaminated regions. Mytilus a Fucus contents are, in general, lower than other reported coastal areas. From data in han would appear that the Alaskan OCS might well the present time, serve as a type example pristine coastal waters as far as heavy metal c tribution are concerned. (Sinha-OEIS)

entifiers: *Outer Continental Shelf, Seston, Gulf Alaska.

e objectives of this continuing work are to termine the kinds and amounts of hydrocarbons water, biota, sediment, and seston in the askan OCS environments and to determine the tent to which hydrocarbons are adsorbed by spended sediments of the Gulf of Alaska. These easurements provide the link between impacts, ch as the decline of a biological population, and spected causes of those impacts, such as the ad- ion of petroleum to the system. Based on work far completed, it appears that the levels of drocarbons in the Alaskan OCS environments e as low as, or lower than other areas of the orld ocean not subject to obvious petroleum pol- ion. The general goal of this project is to mea- re the ambient kinds and amounts of hydrocar- ns in various components of the Alaskan OCS vironment and to study key processes by which dded hydrocarbons are transported and degraded this environment. The primary focus has been e Gulf of Alaska. (Sinha-OEIS)

: Environmental Assessment of the Alaskan ontinental Shelf. Principal Investigators' Reports r the Year Ending March 1976, Vol 10. Chemis- y and Microbiology, p 381-433, April 1976. 14 fig, ab, 50 ref.

escriptors: *Alaska, *Baseline studies, *Water uality, *Resources development, *Distribution tterns, *Oil pollution, *Fish diseases, Patholo- , Demersal fishes, Pollutant identification.
entifiers: *Outer Continental Shelf, Oil explora- n, Oil development, *Petroleum resources, Gulf Alaska, Bering Sea, Beaufort Sea.

e main purpose of this investigation was to ob- in baseline data on the present health status of mersal fishes in waters near Alaska's Outer ontinental Shelf so that future environmental ef- cts of oil exploration and development in these eas can be evaluated. The principal criterion of h health being employed is the frequency of ex- rnally visible pathological conditions. In addi- n, the histopathological and microbiological operties of each major disease are being charac- rized. The geographical areas included in this ork are the Bering and Beaufort Seas, and the ulf of Alaska. During September and October, 75, about 30,000 bottom-dwelling fish from the ering Sea were examined for diseases. The three ost commonly observed diseases and their equency of occurrence were: epidermal papil- mas of rock sole, 1.0%; lymphocystis of yellow- fin sole, 2.1%; and epidermal tumors of the pseu- dobranch of adult Pacific cod, 7.4%. Environmental factors, such as low salinity, higher temperature, suspended sediments, and other factors which affect natural disease resistance, are thought to influence the prevalence of the virus-caused lymphocysis lesions which has never before been reported to occur in marine fish on the northern Pacific coast of North America. Identifiers: *Outer Continental Shelf, Oil exploration, Oil development, *Petroleum resources, Oceanographic processes, Satellite imagery, Trajectory analysis, Regional flow, Hydrocarbons.

The numerical modeling and simulation studies are designed to provide information on advection and diffusion processes, aid in the interpretation of observational data, and present the results in an easy to interpret integrated form. This is to be done for as many of the OCS areas as time and data allow. Tools are being developed that can be applied in any region where the dynamics is appropriately represented and data for verification and boundary condition specification are available. To date, the modeling studies in cooperation with the rest of the physical oceanography program elements have been able to describe circulation patterns for some of the OCS region in considerable detail. In other areas, dominant physical processes have been identified and simulations have been initiated. From the results so far, it seems clear that these studies can integrate certain facets of the OCS program and present results that are a useful part of the assessment evaluation. Appendix I contains the text of an article, 'Circulation Studies on the Alaska Continental Shelf Off the Copper River Delta' - use of diagnostic model with time-dependent barotropic mode simulation to estimate trajectories. BRISTOL BAY OCEANOGRAPHIC PROCESSES (B-BOP),
National Oceanic and Atmospheric Administration, Seattle, Wash. Pacific Marine Environmental Lab.
J. D. Schumacher, and L. K. Coachman.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Year Ending March 1976, Vol 11. Physical Oceanography and Meteorology, p 213-247, April 1976. 14 fig, 13 ref. R7120849.

Descriptors: *Alaska, *Ocean circulation, Pollutants, *Oil pollution, *Water pollution, *Resources development, *Baseline studies, *Environmental effects, Dispersion, Tides, Flow characteristics, Hazards.
Identifiers: *Outer Continental Shelf, *Petroleum resources, Oil exploration, Oil development, Oceanographic processes, *Bristol Bay.

The objective of this work unit was to relate oceanic advective and diffusive processes to potential pollution problems due to OCS petroleum development. From data collected, processed, and analyzed to date, the following conclusions have been made. The mean flow during fall 1975 in Bristol Bay was small (on the order of 1 cm/sec) and was directed toward the northwest flowing along the 50m depth contour; most of the variance energy was in tidal frequency bands; and major events in the flow regime occurred as pulses in the mean flow. This study has provided initial information on mean transport and an indication of the relative importance of dispersion in the Bristol Bay region. (Sinha-OEIS)

OUTER CONTINENTAL SHELF ENERGY PROGRAM,
National Oceanic and Atmospheric Administration, Miami, Fla. Atlantic Oceanographic and Meteorological Labs.
D. V. Hansen.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Year Ending March 1976, Vol 11. Physical Oceanography and Meteorology, p 267-274, April 1976.

Descriptors: *Alaska, *Oil pollution, Pollutants, *Ocean currents, *Ocean circulation, *Resources development, *Water pollution sources, *Environmental effects, *Baseline studies, Dispersion, Hazards, Surface waters.
Identifiers: *Outer Continental Shelf, *Flow patterns, Oil development, Oil exploration, Gulf of Alaska, Hydrocarbons, Energy sources.

The general outline of this study is the acquisition of near surface flow trajectories throughout the entire N.E. Gulf of Alaska OCS region with particular emphasis on the lease area from Yakutat Bay to Prince William Sound. The device for acquiring this information is the NIMBUS-6 satellite and associated TWERLE/RAMS system. The development of improved diagnostic models allows prediction of pollutant trajectories based on the distribution of basic parameters. Also characteristic flow patterns are discernable allowing for

evaluation of petroleum development criteria based on projected pollutant impact zones. To date data shows that: near surface currents in the area are to the west as expected, and sustained speeds on the order of one knot are not unusual; there is indication of very strong topographic influence upon the flow in that current trajectories tend to parallel isobaths, and shoal areas appear to have a leed eddy structure, as might also be expected of islands, that may tend to retain pollutants; and surface pollutants released in the area off Yakutat Bay are likely to go ashore on or east of Kayak Island within two weeks. PREPARATION OF HYDRODYNAMICAL-NUMERICAL AND 3-PARAMETER SMALL-MESH ATMOSPHERIC MODELS FOR COASTAL WATERS IN THE GULF OF ALASKA,
Naval Environmental Prediction Research Facility, Monterey, Calif.
T. Laevastu.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigator's Reports for the Year Ending March 1976, Vol 11. Physical Oceanography and Meteorology, p 275-292, April 1976. 15 fig.

Descriptors: *Alaska, Pollutants, *Ocean currents, *Advection, *Diffusion, *Weather forecasting, *Water pollution, *Resources development, *Baseline studies, *Environmental effects, Coasts, Sea level, Organic compounds.
Identifiers: *Outer Continental Shelf, Oil exploration, Oil development, *Atmospheric models, Gulf of Alaska, Surface winds.

Three two-layer Hydrodynamical-Numerical (HN) models with overlapping boundaries have been programmed, covering the Alaskan coast of the Gulf of Alaska. The principal inputs of these models are tides (at the open boundaries), wind, 'permanent' (thermohaline) current and any release of pollutants. The principal outputs (either as time series at given locations, or as instantaneous area outputs at any given time) are currents, sea level and distribution of pollutants. The small-mesh meteorological model has been programmed to obtain detailed surface wind analyses/forecasts. It takes the boundary conditions from a 'standard' hemispheric analysis/forecast. Also available are spectroangular wave and surf forecasting models, though these were not part of this work unit. (Sinha-OEIS)

MESOSCALE CURRENTS AND WATER MASSES IN THE GULF OF ALASKA,
Alaska Univ., College. Inst. of Marine Science.
T. C. Royer.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Year Ending March 1976, Vol 11. Physical Oceanography and Meteorology, p 293-358, April 1976. 11 fig, 8 ref, append. 03-5-022-56.

Descriptors: *Alaska, *Ocean circulation, *Oil pollution, *Ocean currents, Pollutants, *Upwelling, *Water pollution, *Baseline studies, *Environmental effects, *Resources development, Water quality, Sea level, Weather patterns, Storms, Tides, Diffusion, Dispersion.
Identifiers: *Outer Continental Shelf, *Petroleum resources, Oil development, Oil exploration, *Gulf of Alaska, Mesoscale currents, Water masses, Nearshore circulation, Seasonal variations.

The objectives of this study were to define the physical-chemical environment, transports of pollutants and the long-term monitoring of the physical-chemical environment in the Gulf of Alaska. It was concluded that there are variations in the scale lengths (and probably time scales) of the physical processes in the Gulf of Alaska. The shortest scale lengths were found northeast of Kodiak Island where very complex flows were seen. Another important conclusion is that nearshore surface water can be advected well offshore, as is apparently the case near Kayak Island. While the general flow is as expected, the perturbations on this flow have an important implication in the transport of pollutants. The temperature-salinity measurements show that the waters overlying the continental shelf in the northern Gulf of Alaska change on a seasonal basis. The causes of these changes are the input of heat and freshwater and variations in wind stress. Features in the vicinity of the shelf break and further offshore are semi-continuous around the gulf. The data indicate that the surface water inshore and eastward of Kayak Island moves southwestward and is located along the continental shelf break as it passes Kodiak Island. Apparently, there is a different surface water mass regime west of Kayak Island and inshore from Middleton Island. The changes in complexity of the horizontal structure of the water masses are evident from both the satellite and hydrographic data. These complexities disappear westward along the Alaska Stream. (Sinha-OEIS)

TRANSPORT OF POLLUTANTS IN THE VICINITY OF PRUDHOE BAY, ALASKA,
National Environmental Research Center, Corvallis, Oreg.
R. J. Callaway, and C. Koblinsky.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Year Ending March 1976, Vol 11. Physical Oceanography and Meteorology, p 427-755, April 1976. Chiefly fig and tab. R-50813 and R-60813.

Descriptors: *Alaska, *Arctic Ocean, *Ocean circulation, *Oil pollution, *Water pollution, *Baseline studies, *Resources development, Environmental effects, *Pollutants, Tides, Flushing, Dispersion, *Path of pollutants.
Identifiers: *Outer Continental Shelf, *Petroleum resources, Oil exploration, Oil development, *Pollutant transport, Surface currents, Prudhoe Bay, Simpson Lagoon.

A set of computer runs has been made on a section of the Arctic Coast centered about Prudhoe Bay. Large scale model simulations were reproduced in two fine-grid models interior of the larger area: Prudhoe Bay and Simpson Lagoon. Limited verification of the large-scale model was planned but not completed because of the 1975 ice year. Tide records collected during 1975 inside Thetis and Stockton Islands provide the basis for tidal amplitudes used as input to the models. Additional required input data (bottom topography, winds, runoff) were obtained from USGS, NOS and other sources. The objectives of the study are to determine flushing rates, retention times and pollutant transport in the vicinity of Prudhoe Bay. For this purpose, a single-layer model of circulation was applied in order to compute tidal elevations and surface currents. Inferences were made from the computer output as to probable transport rates and pollutant dispersion. The objectives of the study relate to potential drilling operations in a limited section of the Arctic Coast. Additional inferences can be made as to the influence of marine operations on the environment and vice versa. (Sinha-OEIS)
W77-03238

MARINE CLIMATOLOGY OF THE GULF OF ALASKA AND THE BERING AND BEAUFORT SEAS,
Alaska Univ., Anchorage. Arctic Environmental Information and Data Center.
H. W. Searby.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Year Ending March 1976, Vol 11. Physical Oceanography and Meteorology, p 757-769, April 1976. 7 fig. 03-5-022-56.

Descriptors: *Alaska, *Climatic data, *Oil spills, *Oil pollution, *Resources development, *Baseline studies, *Environmental effects, Climatology.
Identifiers: *Outer Continental Shelf, Oil exploration, Oil development, *Petroleum resources, *Gulf of Alaska, *Bering Sea, Beaufort Sea.

The objective of the project is to provide detailed marine and coastal climatology for input into the planning and operational phases of oil and gas development on the continental shelf. Specific objectives are to present information on temperature, precipitation, wind, and how they relate to such things as cloud cover, wave heights, and visibility (fog). Storm tracks and frequencies, storm surges and coastal flooding are being studied and will be part of the presentation. Such things as potential superstructure icing, tides, surface currents, immersion hypothermia and topography of both land and sea will also be included. Results for this project will be in the form of completed atlases, one each for the Gulf of Alaska, the Bering Sea, and the Beaufort Sea. (Sinha-OEIS)
W77-03239

MARINE CLIMATOLOGY OF THE GULF OF ALASKA AND THE BERING AND BEAUFORT SEAS. PART III. CLIMATIC ATLASES,
Alaska Univ., Anchorage. Arctic Environmental Information and Data Center.
H. W. Searby, and W. A. Brower, Jr.
In Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Year Ending March 1976, Vol 11. Physical Oceanography and Meteorology, p 770-786, April 1976. 16 fig.

Descriptors: *Alaska, *Meteorological data, *Resources development, *Baseline studies, *Environmental effects, *Hazards, Coasts, Air temperature, Ocean waves, Oil spills, Oil pollution, Water pollution.
Identifiers: *Outer Continental Shelf, *Petroleum resources, Oil exploration, Oil development, *Climatic atlases, Marine climatoloty, Gulf of Alaska, Bering Sea, Beaufort Sea.

The investigation is to establish descriptive climatology and data analyses of marine and atmospheric parameters for the outer continental shelf waters of Alaska and determine if results have the necessary temporal and spatial resolution to provide an assessment of risks involved with operating energy related structures in the waters. The present study will provide three atlases to represent the total of the Alaskan waters and each will be based on more than 20 years of additional marine data. Also, as marine data are typically sparse in the near coastal zone, a zone of sharp gradients and complex climate, data for the coastal stations will be included. Such a combination should be the best possible climatological picture for the coastal waters of Alaska. The data processing is nearing completion. About 60% of the statistical graphs have been computed produced and plotting of parameter statistics for 360 charts in isopleth analysis begun. (Sinha-OEIS)

ntifiers: *Outer Continental Shelf, *Petroleum urces, *Oil exploration, *Oil development, jectory analysis, Large scale flow, Planetary ndary layer.

ny near surface meteorological processes act to dify the surface winds in the coastal regions of ska. The modification is generally extensive ugh to seriously effect any attempts at relating optic weather maps to surface conditions. The anic water near the surface is strongly in- nced by the surface stress. As the wind makes ange in speed or direction, the water near the face is strongly affected almost immediately. n with time, the momentum change diffuses nward modifying the interior flow on a much er time scale. A thorough knowledge of coastal d conditions are an important consideration in shore industrial development through its ef- s both on mean flow and the trajectory of sur- e contaminants. The work is designed to define ch processes are acting to modify coastal ds, how prevalent they are, and how far off re they act. Shipboard measurements coupled h all available meteorological data have been ized in this goal. In addition, a study of com- er simulation of coastal meteorological condi- s has been undertaken to assess the applicabili- f a numerical model in making predictions of stal winds. (Sinha-OEIS)

ASTAL MORPHOLOGY AND SEDIMENTA- ON, GULF COAST OF ALASKA (GLACIAL DIMENTATION),
ode Island Univ., Kingston, Dept. of Geology.
. Boothroyd, M. S. Cable, and R. A. Levey.
Environmental Assessment of the Alaskan tinental Shelf. Principal Investigators' Reports the Year Ending March 1976, Vol 12. Geology, 7-213, April 1976. 19 fig, 67 ref, 2 append. 03-5- -82.

scriptors: *Alaska, *Hazards, *Sedimentation, sources development, *Baseline studies, vironmental effects, *Water pollution, *Cold ons, Glacial sediments, Ice, Weather data, ps, Geologic investigations.
ntifiers: *Outer Continental Shelf, Oil develop- t, *Gulf of Alaska, Coastal morphology, re facilities, Braided outwash fans.

The major emphasis of the project was to evaluate present rates of change in coastal morphology, with particular emphasis on the possible impact of man-induced changes. Also the purpose of the study was to locate areas where the coastal environment is likely to be changed by man's activities and evaluate the effect of these changes, if any; and to evaluate effect of various geologic processes on man's activities in specific areas along the coast. The major information products included in this report are a series of large-scale maps and charts accompanied by photographs that illustrate specific features on those maps. The maps and charts are: Location map for the West Malaspina Foreland and Icy Bay area; Geologic hazards and processes map of the West Malaspina Foreland and Icy Bay area; Preliminary bathymetric chart of Icy Bay; and Environmental map of the east margin of Icy Bay. An appendix is included containing a table of weather data and drift-ice observations collected during the summer field season and a reprint of a paper (Boothroyd and Ashley, 1975) discussing outwash fan sedimentation on the northeast Gulf of Alaska, including Yana Stream on the West Malaspina Foreland. A 'HERRING-BONE' PATTERN OF POSSIBLE TAYLOR-GORTER-TYPE FLOW ORIGIN SEEN IN SONOGRAPHS,
Geological Survey, Menlo Park, Calif.
L. J. Toimil, and E. Reimnitz.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Year Ending March 1976, Vol 12. Geology,p 626-640, April 1976. 4 fig, 15 ref.

Descriptors: *Alaska, *Flow characteristics, *Arctic Ocean, *Resources development, *Baseline studies, *Environmental effects, *Water pollution, Lagoon, *Sonar, Path of pollutants.
Identifiers: *Outer Continental Shelf, Oil exploration, Oil development, *Herring-bone patterns.

The potential usefulness of side-scan sonar in detailed studies of helical flow phenomena is indicated by records obtained within a shallow Arctic lagoon. The records reveal a 'herring-bone' like pattern of current aligned linear relectors with branching diagonals. Major longitudinal reflectors have no detectable relief and are believed to represent current-aligned, winnowed zones of the lagoon's silty fine sand. The winnowing processes are interpreted to occur along regions of helical cell divergence, suggesting a three-dimensional Taylor-Gorter flow origin. (Sinha-OEIS)

A subsea permafrost drilling program was carried out during late April and May 1975 at a site near the northwest side of Prudhoe Bay, Alaska. Two-meter thick fast ice was used as a drilling platform to drill into the seabed. This report describes the drilling and sampling procedures used. The techniques and results of the soil analysis, temperature measurements, salt concentration measurements, permeability measurements, and penetration tests are also given. Field drilling logs are included. (Sinha-OEIS)

Descriptors: *Water quality, *Surveys, *Rivers, *Idaho, Sampling, Standards, *Water quality standards, Water pollution, Pollutants, *Pollutant identification, Water pollution sources, Biochemical oxygen demand, Coliforms, Pesticides, Heavy metals, Mercury, Turbidity, Hydrogen ion concentration, Dissolved oxygen, Water temperature, Nutrients, Bacteria, Watersheds(Basins), Water pollution control.
Identifiers: *Bear River Basin(Idaho).

The quality of the waters in the Bear River Basin was surveyed from August 27 to August 29, 1974. The purposes of the survey were to determine point and non-point source loading, to determine whether water quality has improved since the adoption of the 1958 Enforcement Conference pollution control measures, to determine the cause and effect relationships between major waste sources and receiving water quality, and to determine whether major waste sources are complying with their NPDES permits. Survey results showed violations of Idaho Water Quality Standards in these parameters: bacteria, turbidity, and dissolved oxygen. Also, level of Lindane, a chlorinated hydrocarbon pesticide, and mercury significantly higher than the recommended maximal levels were found in the upper reaches of the Bear River. Although sufficient data since 1958 were not available to evaluate the pollution control measures, water quality changes in BOD's and total coliform bacteria were noted. The Monsanto Company was found to comply with their NPDES permit in all but one area, there was an apparent temperature violation. Nutrient loading was investigated and related to algal productivity, but not all loading sources were located. Other findings included realization that point sources did not appreciably affect the quality of the Bear River except in very localized areas. (Sims-ISWS)

26.

tors: *Heavy metals, *Soil chemical pro-
*Sewage, *Irrigation, *Plant growth,
ts, Metals, Sewage disposal, Toxicity,
n, Phosphorus.

Reactions of heavy metals with soils are reviewed, with particular emphasis on their application during the irrigation of crop lands with liquid sewage. Topics discussed include: the fate of heavy metals in soils, the mechanisms of removal of individual or grouped heavy metals, and the uptake and tolerance of heavy metals by plants. The use of specialists crops for harvesting unwanted accumulations of heavy metal does not appear to be feasible. As an alternative, the removal of metal-laden top soil is suggested so that the subsoil rich in nutrients from previous applications of nitrogen and phosphorus can be utilized. (Kreager-FIRL)
W77-03359

THE IMPACT OF FARGO, NORTH DAKOTA'S WASTE DISCHARGES ON THE INTERSTATE WATERS OF THE RED RIVER OF THE NORTH, SEPTEMBER 1969-APRIL 1970,
Federal Water Quality Administration, Kansas City, Mo.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-245 755, Price codes: A03 in paper copy, A01 in microfiche. July, 1970. 31 p, 4 fig, 8 tab.

Descriptors: *Water pollution, *Rivers, *Sewage treatment, *Treatment facilities, *Water pollution effects, Monitoring, On-site investigations, Dissolved oxygen, Biochemical oxygen demand, Suspended solids, Surface waters, North Dakota, Efficiencies, Performance, Waste treatment, Effluents, Bacteria, Organic compounds.

The impact of waste discharges from Fargo, North Dakota's sewage treatment plant on the Red River of the North was evaluated during field study conducted from September 1969 to April 1970. The total pounds of biochemical oxygen demand (5-day) discharged from the Fargo-Moorhead area during the survey period ranged from 4203/day in March to a high of 44,241/day in October. The quantity of wastes from Fargo steadily increased as the efficiency of the Fargo sewage treatment plant declined during the winter months, with Fargo contributing a maximum of 82% of the total organic waste load discharged from the Fargo-Moorhead area in March. The combined waste discharges from the Fargo-Moorhead area had an adverse effect on the water quality of the Red River of the North as evidenced by numerous violations of dissolved oxygen and bacterial criteria and violations of the state effluent requirements. Monthly averages of dissolved oxyen concentrations less than 5 milligrams/liter were observed for samples collected during the winter months. Monthly average effluent concentrations for samples taken from the Fargo sewage treatment plant always exceeded North Dakota's effluent criteria of 25 milligrams/liter biochemical oxygen demand and 30 milligrams/liter total suspended solids. Dissolved oxygen levels in the Milner reach of the Snake River, between Minidoka Dam and Milner Dam in southwestern Idaho, are influenced strongly by river hydrology and point source discharge of organic wastes. Non-controllable factors, including sediment demand, surface transfer and non-point source biological oxygen demand, are also important. The Milner reach had been classified as water quality limited, with extended periods of low dissolved oxygen and especially critical conditions during periods of low flow when discharges from municipal and industrial waste sources were at their peak. In 1974 National Pollutant Discharge Elimination System permits were drafted for two industrial waste sources in the Burley-Heyburn area, and the permit writing process was supported by mathematical modelling which showed that point source discharges would contribute measureably to the violation of dissolved oxygen standards even if the discharge satisfied appropriate existing guidelines. The purpose of the present survey was to provide data for validating the mathematical model and to assess ambient water quality during low flow. A compliance monitoring program for industrial and municipal waste sources in the area was designed to be conducted concurrently with the in-stream survey. (Harris-Wisconsin)

THE IMPACT OF A FOREST FIRE ON A WILDERNESS LAKE IN NORTHEASTERN MINNESOTA,
Minnesota Univ., Minneapolis. Limnological Research Center.
J. P. Bradbury, S. J. Tarapchak, J. C. B. Waddington, and R. F. Wright.
In: Verhandlungen Internationale Vereinigung Limnologie, Vol 19, Part II, p 875-883, 1975. 7 fig, 1 tab, 14 ref.

Descriptors: *Lakes, *Forest fires, *Minnesota, Forests, Nutrients, Runoff, Environmental effects, Phosphorus, Paleolimnology, Watersheds(Basins), Oligotrophy, Phytoplankton, Chemical analysis.
Identifiers: *Meander Lake(Minn), Dogfish Lake(Minn), Boundary Waters Canoe Area.

Possible forest fire induced limnologic changes are evaluated by comparing the post-fire hydrology, chemistry and phytoplankton biology of the nearly virgin-forested watershed of Meander Lake with that of the similar, unburned nearby Dogfish Lake, and by a detailed paleolimnologic analysis of a 60-cm core of Meander Lake surface sediments. The impact of the Little Sioux fire on the chemical and hydrologic processes was evaluated by comparing cation budgets. This comparison showed that runoff increased 60%, potassium and phosphorus exports increased 265% and 93% respectively, and calcium, magnesium, and sodium exports did not change significantly. Nutrient losses were less than observed elsewhere and there was no drastic increase in nitrate export. Increased phosphorus loading of Meander Lake was only 38% greater than that of Dogfish Lake, falling within the natural year-to-year variation. This increase did not have a pronounced effect on the standing crop of phytoplankton. Paleolimnologic analysis of sediment cores suggest that while logging activities before the fire may have had a real impact on the limnology of the lake, the fire had little impact despite the fact that it burned nearly 70% of the watershed. It is concluded that while the Little Sioux fire, a spring fire, may not be typical of late summer and fall fires, nutrient losses from it were minimal. (Luedtke-Wisconsin)

Identifiers: *Calumet River(Ill-Ind), Grand Calumet River, Little Calumet River, Wolf Lake(Ill-Ind).

Despite initiation of numerous pollution abatement measures in compliance with the Calumet Area Conference requirements stipulated at various meetings since 1965, not all water quality criteria have been met at all control points in the heavily-industrialized area and additional abatement measures are necessary. A review committee with an intergovernmental agency membership reports these water quality changes: (1) In open water there has been a deterioration of water quality in terms of threshold odor, oil and grease. Total phosphorus levels remain the same and other parameters show an improvement or no change. (2) In the inner harbor basin water quality has decreased because of grease and oil levels. Most other parameters, including total phosphorus, show little or no change. (3) No significant change is found in shore water. (4) Waters of the Grand Calumet River east to the Indiana Harbor Canal show improvement in most parameters. (5) Waters of the Grand Calumet River west to Illinois have deteriorated. (6) In the Little Calumet River west to Illinois, in Wolf Lake and in the Calumet River along the lake side of the O'Brien locks there has been no significant change except for bacterial water quality deterioration at Hammond Beach on Wolf Lake and a slight improvement at the mouth of the Calumet River. Identifiers: Willamette River.

A summary report on pollution sources and effects along a 104-mile section of the lower Columbia shows that average daily biochemical oxygen demand (BOD) from pulp and paper mill waste loadings added to the river increased from 613,000 pounds in 1959 to 778,000 pounds in 1964. These wastes, nearly six times as great as those from all other sources combined, are primarily responsible for the development of abundant slime growths that flourish in the river and interfere with commercial and sport fishing by fouling nets and gear. Wood and fibers, moreover, add strength and body to the slimes and make them more difficult to remove from the equipment. The mills from Camas to Longview discharge these fibers along with dissolved organic wastes. Fiber decomposition is so slow that with existing river flows the increment of fibers from each successive waste discharge increases the downstream concentration. Slime is especially troublesome when river flow rates are less than 220,000 cubic feet per second and the water temperature 10-15 degrees centigrade. Pulp and paper mills should design and build mechanically-cleaned primary treatment facilities for mill wastes. Next, BOD loadings derived from spent sulfite liquor discharged by the industry at Camas and Vancouver should be reduced, and liquor solids should no longer be barged to the Columbia from its tributaries. Identifiers: *Colville River delta(Alaska), Beaufort Sea.

Spring breakup flooding of the Colville River in northern Alaska plays a significant role in raising the inorganic nitrogen level and the ratio of inorganic nitrogen to phosphate to a more nutrient-balanced state for phytoplankton assimilation in the nearshore waters of the Beaufort Sea area of the Arctic Ocean. The Colville is similar to rivers in other climactic regions characterized by pronounced seasonal variation in that it has distinct periods in its annual hydrologic cycle. The Colville ceases to flow during much of the winter. During breakup in early June, its floodwater moves seaward beneath the sea ice but above the sea water. Comparisons of analyses made of vertical offshore variations show no significant variation in nutrient concentration during the wint
But with the breakup, vertical variations beco
pronounced. The freshwater layer showed mic
gram levels per liter for various inorganic nutrie
to be 50% to 300% greater than the levels obtai
from the seawater specimens. With the onset
winter, seawater penetrates upstream beneath
ice and becomes dominant in all channels c
nected with the coastal waters. Melt water usu
appears in the latter part of May. When it reac
sufficient depth, it flows downstream to the sea
top of the bottom fast ice and beneath the floa
ice cover. The flow flushes sea water from
channels within two or three days. (Har

COLYSIS OF 5-CHLOROURACIL IN URAL WATERS,
Ridge National Lab., Tenn. Environmental ces Div.
Southworth, and C. S. Gehrs.
Research, Vol. 10, No. 11, p 967-971, 1976. 20 ref.

iptors: *Pollutant identification, Water *Stability, *Chemical reactions, *Aqueous ons, Ultraviolet radiation, Solar radiation, ics.
fiers: *Photolysis, *Chlorouracil.

Investigations were made of the stability of 5-chlorouracil in dilute aqueous solution when exposed to UV radiation equal to sunlight and to determine the rate and mechanism of the photolysis process. Photolytic reduction of 5-chlorouracil concentrations in natural waters vary with seasonal changes in the aquatic environment. Absorption of UV radiation by dissolved organic matter makes photolysis insignificant at depths greater than 1 m. A decrease in photolysis occurs during winter with low light and temperature, due to the lower pH associated with less photosynthetic activity, and due to lower incident UV levels and the shift in threshold photolysis pH with lower temperatures. Acidic conditions also inhibited photolysis during any combination of temperature and illumination. Photolytic decomposition of 5-chlorouracil is most significant in relatively shallow, clear, alkaline water bodies and less in acidic, colored, or turbid waters. It was suggested that the photolysis reaction observed was basically photohydrolysis. Though natural sunlight-induced photolysis reduces 5-chlorouracil concentrations added to natural waters by chlorination, usually the rate is not fast enough to significantly reduce the quantity added to the environment. Therefore, sunlight UV radiation cannot be counted upon to reduce environmental consequences of the introduction of 5-chlorouracil into natural waters. (Collins-FIRL)

HYGIENIC STANDARDIZATION OF THE CONTENT IN WATER OF MONOISOBUTYLAMINE AND DIISOBUTYLAMINE DURING THEIR COMBINED ACTION, (IN RUSSIAN),
Sanitarno-Gigienicheskii Meditsinskii Institut, Leningrad (USSR).
M. N. Kuklina, and S. A. Zyabbarova.
Gig Sanit 4, p 39-41, 1975.

Descriptors: *Organic compounds, Public health, Organic wastes, Water quality standards, Reactions, Lethal limit.
Identifiers: *Butylamines.

The combined action of mono- and diisobutylamine, which have the same limiting index of noxiousness, consists of a simple summation of the effect. (Experiments were conducted on rats and rabbits.) When jointly present in a water body, their content should not excees 1/2 of the maximum permissible concentration. The simultaneous presence of mono- and diisobutylamine at this level does not cause a deterioration of the organoleptic properties of water, disturb natural purification processes nor have any toxic action. (The dynamics of saprophytic microflora were also studied.)--Copyright 1976, Biological Abstracts, Inc.

Identifiers: *New York Harbor, Primary effluents, Secondary effluents, Differential sedimentation.

A 10% annual increase in coliform pollution in New York Harbor waters since the early 1950's--a period marked by continuing sewage treatment plant construction in the area--may have been a direct result of the improved treatment practice, as suggested by comparisons with data from other sources. Blame for the bacterial pollution was first assigned to an 'aftergrowth' of organisms in the receiving waters stimulated by nutrients such as phosphate or nitrogen compounds in secondary treatment effluent. But studies of marked coliform increases at five inland locations with improved waste treatment programs of relatively recent origin show that phosphate, detergent and other pollution parameters do not clearly correlate with coliform increases. However, examination of Los Angeles' Hyperion Treatment Plant and its effects on the waters of Santa Monica Bay suggest that New York Harbor's coliform problem is due to the changed behavior of suspended solids in the effluents. At Santa Monica Bay, suspended solids in primary effluent settled with a rate coefficient four times that for secondary effluent, and the coliforms associated with the solids were, of course, similarly affected. Analysis of this settling proclivity differential shows that such coliform increases may be expected when improved treatment, but not effluent chlorination, is provided. (Harris-Wisconsin)

SIMULATION OF PESTICIDE MOVEMENT ON SMALL AGRICULTURAL WATERSHEDS,
ESL, Inc., Sunnyvale, Calif.
R. T. Adams, and F. M. Kurisu.
Report No EPA-600/3-76-066, Ecological Research Series, September 1976. 342 p, 138 fig, 14 tab, 65 ref, 3 append. 68-01-0721, 68-01-2977.

Descriptors: *Path of pollutants, *Pesticide kinetics, *Soil physical properties, *Simulation analysis, Pesticides, Pesticide residues, Movement, Infiltration, Percolation, Volatility, Leaching, Adsorption, Persistence, Runoff, Evaporation, Soil profiles, Agriculture, Model studies, Degradation, *Agricultural watersheds, Mathematical models, Computer models.
Identifiers: *SCRAM, Sensitivity analysis.

A computer model, SCRAM, (Simulation of Contaminant Reactions and Movement) designed to predict the movement of pesticides from agricultural lands, is described and its predictive capability tested. SCRAM is composed of a number of deterministic submodels which describe infiltration, percolation, evaporation, runoff, sediment loss, pesticide adsorption and desorption in the soil profile, pesticide microbial degradation in the soil profile, and pesticide volatilization processes. SCRAM predictions of these physical processes were compared to experimental data from two small watersheds near Athens, Georgia. Simulation of surface runoff agreed reasonably well with experimental measurements, while sediment loss predictions did not. Predictions of pesticide loss in the runoff and on the sediment were in general

agreement with experimental data, after allowing for inaccurate sediment loss predictions. Tests of the model for pesticide movement in the soil profile indicated: (1) that some diphenamid was transported more rapidly below 5 centimeters, remained longer in the upper 5 centimeters, and degraded similarly to the experimental results; (2) initial atrazine movement into the soil was more rapid than predicted and its degradation was not in agreement; (3) simulated rates of pesticide removal from the soil surface was too rapid; and (4) simulated trifluralin volatilization losses were somewhat unsatisfactory, while its movement in the soil profile was in close agreement with experimental measurements. SIGNIFICANCE OF NITRATES IN DRINKING WATER, (IN RUSSIAN),
Belorussian Sanitary-Hygienic Research Inst., Minsk (USSR).
L. L. Livshits, A. G. Kokina, and G. I. Lazyuk.
Gig Sanit 5, p 103 104, 1975.

Descriptors: *Nitrates, *Potable water, *Water wells, Artesian wells, Water analysis, Water pollution, Cities, Groundwater, *Nitrogen, Soils, Rural areas.
Identifiers: *Belorussian-Ssr, *USSR, Nitrate nitrogen, *Neonates.

The data of many investigators indicate the occurrence of methemoglobinemia in connection with the consumption of drinking water containing nitrates in quantities exceeding 10 mgN/1. An investigation of 1098 artesian and dug wells in all regions of the Belorussian SSR (USSR) revealed that the water of 80.27% of the wells contained nitrates in a quantity > 10 mg N/1. There was an inverse relation between the nitrate concentration and depth of the wells and a direct relation between the nitrate content in the well water and amount of precipitation, which indicated that the nitrate concentration in well water reflects the effect of the degree of soil pollution of the investigated rural areas. A study of 27,383 histories of urban and rural neonates did not reveal significant differences in the proportion of neonates with congenital defects of fetal development among rural inhabitants in comparison with urban. A comparison of the number of term neonates with a relatively low weight (up to 3.5 kg) in urban and rural locales did not reveal significant differences. A high content of nitrate N in groundwaters is not considered one of the factors promoting fetal antenatal hypotrophy.--Copyright 1976, Biological Abstracts, Inc.

A MODEL FOR THE CONTROL OF DISSOLVED MANGANESE IN THE INTERSTITIAL WATERS OF CHESAPEAKE BAY,
Johns Hopkins Univ., Baltimore, Md. Dept. of Earth and Planetary Sciences.
G. R. Holdren, O. P. Bricker, and G. Matisoff.
Available from the National Technical Information Service, Springfield, VA 22161 as COO-327 919, Price codes: A02 in paper copy, A01 in microfiche. Report CONF-750410-8, (1975). 18 p. 6 fig., 1 tab., 33 ref. AEC AT(11-1)-3292.

Descriptors: *Chesapeake Bay, *Model studies, *Manganese, *Pore water, Inlets(Waterways), Estuaries, Interstices, Subsurface waters, Chemical properties, Ionization, Acidity, Sediments, Bottom sediments, Diagenesis, Path of pollutants, Distribution.
Identifiers: *Dissolved manganese.

A model is described which predicts dissolved manganese distribution in the anoxic pore waters of the sediments of Chesapeake Bay, where greater concentrations of the metal have been found than in any other marine or brackish water sediment system. The model was developed from observations on the pore water composition and describes the results of two independent competing reactions. Both reactions are continuous over the whole sediment column, and the final calculated concentration of dissolved manganese at any particular depth is dictated by the process most limiting the concentration at that depth. The model requires knowledge of the acidity of the pore waters, the distribution of bicarbonate ion with depth in the sediment, the amount of manganese oxide in the surface sediment and the rate of release of manganous ion from those solids. In the model, the diffution coefficient and sedimentation rates were assumed as constant through space and time, respectively, and it was assumed that steady state has been reached in the system and that with depth in the core manganous ion was in equilibrium with a poorly-crystalline carbonate phase. Agreement is generally good between the model and the field data, suggesting that the processes controlling the distribution of dissolved manganese in the bay sediments are basically understood. (Harris-Wisconsin)

THE IMPACT OF INTENSIVE APPLICATION OF PESTICIDES AND FERTILIZERS ON UNDERGROUND WATER RECHARGE AREAS WHICH MAY CONTRIBUTE TO DRINKING WATER PROBLEMS,
Environmental Protection Agency, Washington, D.C. Office of Toxic Substances.
D. Garrett, F. P. Maxey, and H. Katz
Available from the National Technical Information Service, Springfield, VA 22161 as PB-251 181. Price codes: A06 in paper copy, A01 in microfiche. January, 1976. 110 p, 12 fig, 6 tab, 103 ref. Technical Report No. EPA 560/3-75-006.

Descriptors: *Water pollution, *Groundwater recharge, *Farms, *Fertilizers, *Pesticides, Waste disposal, Septic tanks, Cesspools, Soil types, Soil water movement, Potable water, Groundwater, Nitrates, Nitrification, Denitrification, Chemical wastes, Farm wastes, Nitrogen compounds, Path of pollutants.

An assessment of the impact of intensive application of pesticides and fertilizers on underground water recharge areas is presented, with particular emphasis on agricultural feedlot operations. Pesticides appear to offer only a marginal threat to groundwater quality because of their adsorptive properties in the soil structure and/or their short-lived persistence. Exceptions to this include the improper application of pesticides or the existence of sandy soils or thin soils overlaying fissured rocks. With regard to fertilizer application, more information on the amount of nitrate reaching the groundwater is required. Septic tanks on farms present an insignificant source of pollution to groundwater in terms of public drinking water supplies. However, well water supplies on a particular farm may be susceptible to contamination from septic tanks. Cesspools represent a significantly greater groundwater pollution source, although such installations are now widely prohibited. More information on the processes of nitrification and denitrification in various soils and subsoils as a function of soil temperature, climate, and biochemistry is needed in relation to animal waste applications and fertilizer and crop cover sources of nitrogen. (Kreager-FIRL)

STAL REGION RESIDENCE TIME ESTI- ES FROM CONCENTRATION DIENTS,
rio Ministry of the Environment, Toronto.
. Palmer.
nal of Great Lakes Research, Vol. 1, No. 1, p 41, October 1975. 8 fig, 3 tab, 11 ref.

riptors: *Great Lakes, *Water pollution ef- , *Coasts, *Trophic level, *Lakes, Water ty, Mass transfer, Boundary processes, ytical techniques, Surveys, Waste r(Pollution), Phosphorus, Chlorophyll, ada, *Path of pollutants, *Lake Superior. ifiers: *Residence time, *Concentration ents, *Thunder Bay(Ontario).

ethod for estimating the annual mean mass ange of dissolved solids (as measured by con- vity) and total phosphorus between coastal ffshore waters was discussed. This estimate evolved from concentration contours, water nes, and loadings using two assumptions: (1) ndwater exchange and atmospheric loadings egligible compared to other loadings, and (2) pration and precipitation are approximately . The annual mean mass exchange for the y conservative substance (dissolved solids) evaluated from the continuity equation using ng figures and the concentration contours for uctivity. A coastal residence time was esti- d for conductivity. The coastal residence time defined as the volume of the substance con- d in the coastal region divided by the mass nges for steady state. A similar technique sed for total phosphorus with the mass lost limentation determined by assuming that the coastal residence times for the dissolved solids and total phosphorus are similar. From the residence times, total phosphorus loadings, and details of the coastal region, it was possible to estimate the trophic state. The method was applied to surveys in the Thunder Bay region where the coastal region residence time was found to be 40 days and 40% of the discharged total phosphorus being lost to uptake sedimentation. The trophic state at the shallow nearshore region was found to be more eutrophic than the deeper, farther offshore regions. (Humphreys-ISWS)

IMPACTS OF THE DEPOSITION OF DREDGED SPOILS ON LAKE ERIE SEDIMENT QUALITY AND ASSOCIATED BIOTA,
State Univ. of New York Coll. at Buffalo. Great Lakes Lab.
R. Sweeney, R. Foley, C. Merckel, and R. Wyeth.
Journal of Great Lakes Research, Vol. 1, No. 1, p 162-170, October 1975. 1 fig, 3 tab, 28 ref.

Descriptors: *Lake Erie, *Spoil banks, *Dredging, *Water quality, Water pollution effects, On-site investigations, On-site data collections, Sediments, Water analysis, Biota, Benthic fauna, Oligochaetes, Nematodes, Heavy metals, Nitrogen, *Lake sediments, Nutrients, Water pollution sources.

Sediment samples were collected during June, August, and November, 1973 from 25 equally spaced stations over an area of nearly 64 sq km, the center of which was approximately 12 km north of Cleveland, Ohio. Within this zone was a United States Corps of Engineers 16.5 sq km dump site in which more than 18,960,000 cu m of dredgings from Cleveland Harbor and the Cuyahoga River had been deposited between approximately 1925 and 1968. Seven of the above stations were situated in this former dump site. Simultaneous collections were made at 25 equally spaced stations in a 64 sq km area situated southwest and adjacent to the region described above. The latter area had not been used as a dump site. Sediment gathered with Ponar dredges was analyzed for BOD, COD, phosphates (soluble and total), nitrogen (nitrates, ammonium, organic and total), oils and greases, chlorine demand, and heavy metals (mercury, iron, cadmium and chromium). In addition, quantitative and qualitative analyses for benthic macroinvertebrates were conducted. The concentrations of nutrients (phosphorus and nitrogen), toxicants (heavy metals), and pollutants (as indicated by chlorine demand, BOD, COD and oils and greases measurements) in the surface sediments generally were higher in the dump site than in the surrounding sediments. With regard to benthic macroinvertebrates, the lowest species diversity indexes and a highest oligochaete-to-total organism ratio generally were observed in the former spoils deposition region. It was concluded that the quality of the benthic environment was degraded by past dredging disposal practices. (Humphreys-ISWS)

EFFECTS OF POTASSIUM ON ADULT ASIATIC CLAMS, CORBICULA MANILENSIS,
Illinois Natural History Survey, Urbana.
K. B. Anderson, C. M. Thompson, R. E. Sparks, and A. A. Paparo.
Biological Notes No. 98, Illinois Natural History Survey, Dept. of Reg. and Ed., Natural History Div., Urbana, July 1976, 7 p, 3 fig, 12 ref. OWRT B-097-ILL(1). 14-31-0001-6072.

Descriptors: *Clams, Aquatic environment, Mollusks, *Potassium, *Ions, Metals.
Identifiers: Mollusk control, *Metal ions, *Asiatic clams, Molluscacides.

Preliminary research results indicate that the use of metal ions, particularly potassium, alone or in conjunction with a molluscacide may possibly control the troublesome Asiatic clam population corbicula manilensis without damaging other organisms in the surrounding environment, if used cautiously and selectively. These conclusions were reached after testing the sublethal and lethal effects of potassium concentrations on the clam under laboratory conditions. The results indicated that potassium acts quickly to produce sublethal effects (foot immobilization and gaping); both effects were produced within 48 hours with the threshold concentration of potassium for foot immobilization being 120 mg per liter of water and for gaping 190 mg/liter. For a 96-hour period, a concentration of 225 mg/liter was lethal to 50% of all the test organisms. The investigators, in presenting their data and their discussion, recommend further research.

Identifiers: Aphanizomenon-Flos-Aquae, Oscillatoria-Rubescens, Rhodomonas-Minuta, Stephanodiscus-Hantzschi, *Switzerland, *Lake of Geneva(Switz).

The living organisms in a lake are classified according to their ecologic role, as producers (chlorophyll bearing organisms), consumers (zooplankton, benthos and fishes) and decomposers (lower fungi, bacteria). The phytoplankton includes permanent species, such as Rhodomonas minuta and seasonal species like Stephanodiscus hantzschii, which develops explosively in spring. Occasional species include Oscillatoria rubescens and other Cyanophaceae (Aphanizomenon flos-aquae).--Copyright 1976, Biological Abstracts, Inc.

EXPERIMENTAL STUDIES ON THE SECOND INTERMEDIATE HOSTS OF CLONORCHIS SINESIS: III. OBSERVATIONS ON THE RELATIONSHIP BETWEEN CLAVATE CELLS OF EPIDERMIS AND INFECTIVITY OF METACERACARIAE OF CLONORCHIS SINESIS IN FRESHWATER FISH, (IN KOREAN),
J. K. Rhee.
Korean J Parasitol 12(2); p 101-110, 1974.

Descriptors: *Fish, *Systematics, Asia, *Fish diseases, Freshwater fish, Rivers, Carp, Pollutant identification, Water pollution effects, *Fish parasites.
Identifiers: Acheilognathus-Spp, Anguilla-Japonica, Carassius-Carassius, *Clonorchis-Sinensis, Cobitis-Taenia, Coreoleuscus-Splendius, Coreoperca-Herzi, Cultriculus-Eigenmanni, Gnathopogon-Spp, Liobagrus-Mediadioosalis, *Metacercariae, Microphysogobio-Koreensis, Misgurnus-Anguillicaudatus, Parasilurus-Asotus, Pelteobagrus-Fuluidraco, Pseudogobio-Esocinus, Pseudoperilampus-Spp, Pseudorasbora-Parva, Pungtungia-Herzi, Relationship, Sarcocheilchthys-Czerskii, Zacco-Platypus, *Korea, *Clavate cells.

Epidermis samples from 26 spp. of fresh water fish from the main rivers of Korea were examined histologically. Generally the clavate cell had a simgle nucleus at its center. In Liobagrus mediadiposalis and Pelteobagrus fuluidraco the clavate cell had 2 nuclei with and independent so-called light halo of Oxner and sometimes had none of them. In Misgurnus anguillicaudatus, Cobitis taenia, L. mediadiposalis, P. fuluidraco, Parasilurus asotus and Anguilla iaponica, scales were not detected or were buried in the dermis layer, and the epidermis mostly consisted of clavate cells; no metacercariae were found. In Cyprinus carpio, Carassius carassius (crusian carp and golden crusian carp), Sarcocheilchthys czerskii, Pungtungia herzi and Coreoleuciscus spendius, scales were exposed over the epidermis, in which clavate cells were abundant; a few metacercariae were detected. No clavate cells were observed in Pseudorasbora parva, Zacco platypus, Microphysogobio koreensis, Gnathopogon majimae, G. Coreanus, Achelognathus signifer, A. vamatsutae, Cultriculus eigenmanni, Coreoperca herzi, Pseudoperilampus uvekii, P. notatus or Pseudogobio esocinus. These fishes with exposed scales on the epidermis serve as 2nd intermediate hosts of C. sinesis, Clavate cell presence in the epidermis of the fresh water fish seems correlated with the infectivity of the metacercariae of C. sinesis.--Copyright 1976, Biological Abstracts, Inc.

EFFECT OF ZINC-COATED CULVERTS ON VERTEBRATE AND INVERTEBRATE FAUNA IN SELECTED MAINE STREAMS,
Maine Univ., Orono. Dept. of Zoology.
R. W. Gregory, and J. Trial
Available from the National Technical Information Service, Springfield, VA 22161 as PB-262 344, Price codes: A02 in paper copy, A01 in microfiche Maine Land and Water Resources Institute, Orono, Completion Report, September 1975. 18 p, 9 tab, 39 ref. OWRT A-033-ME(1).

Descriptors: Zinc, *Culverts, Heavy metals, Benthic fauna, *Toxicity, Trout, *Maine, Streams, *Corrosion, Invertebrates, Atlantic salmon, Water pollution effects.
Identifiers: *Zinc toxicity, Vertebrate avoidance threshold, Galvanized culverts corrosion, Invertebrate diversity, Spongilla sp.

The effect of zinc loss from galvanized culverts on vertebrate and invertebrate fauna was investigated. Methods of analysis included the Mann-Whitney test for zinc analysis, electrofishing, invertebrate collection with a Hess sampler, and use of Simpson's diversity index. Results indicate that corrosion of galvanized culverts significantly increases zinc concentrations in stream water, particularly in newer culverts, although culverts five to six years old also demonstrate significant zinc losses. Highest zinc concentrations were found during conditions of highest temperature (20C) and low flow. No adverse effects of increased zinc concentrations were documented for either fish distribution or invertebrate diversity or abundance, with the possible exception of Spongilla. However, levels of zinc are at times, above the avoidance threshold (0.05 ppm) of Atlantic salmon, a particular concern in Maine. (Hutchins-Maine)

EFFECTS OF MERCURY AND COPPER ON THE OLFACTORY RESPONSE IN RAINBOW TROUT, SALMO GAIRDNERI,
Fisheries and Marine Service, Winnipeg (Manitoba). Freshwater Inst
T. J. Hara, Y. M. C. Law, and S. MacDonald
Journal of the Fisheries Research Board of Canada, Vol 33, No 7, p 1568-1573, July, 1976, 1 tab, 6 fig, 36 ref

Descriptors: *Rainbow trout, *Mercury, *Copper, *Analytical techniques, Environmental effects, *Bioassay, *Fish physiology, *Bioindicators, *Fish behavior, Methodology, Heavy metals, Biochemistry, Trout
Identifiers: *Olfactory response, *Olfactory sensitivity

The effects of mercury and copper on the olfactory response of rainbow trout (Salmo gairdneri) were studied by perfusing HgCl2 and CuSO4 solutions through the olfactory organs while recording the olfactory bulbar electrical responses to the standard stimulant, L-serine. The olfactory response was depressed during exposure to mercury and copper. The lowest concentrations of mercury and copper needed to cause appreciable effects within 2 h were estimated at 0.10 and 0.008 mg/liter, respectively. The depression increased with increase in the concentration and exposure time of the heavy metals. Recovery of the olfactory response was slower with higher concentrations and longer exposure. The method is rapid, accurate, and sensitive, and can be applied to other toxic chemicals and fish species. (Katz)

TOXICITY OF NO. 2 FUEL OIL TO COON STRIPE SHRIMP,
Battelle Pacific Northwest Labs., Sequim, Wash Marine Research Labs.
J. R. Vanderhorst, C. I. Gibson, and L. J. Moore
Marine Pollution Bulletin, Vol 7, No 6, June 1976, p. 106-108, 1 tab, 16 ref

Descriptors: *Oil, *Oil spills, *Water pollution effects, Crustaceans, *Shrimp, *Toxicity, *Bioassay, Laboratory tests, Laboratory animals, Fuel, Marine pollution, Marine animals, *Marine fisheries
Identifiers: No. 2 Fuel Oil, Coonstripe shrimp, Continuous flow bioassays, 96 hr L50, Pandalus danae.

Bioassay of a No. 2 fuel oil dispersion with shrimp in a continuous flow system using measured waterborne oil as the indicator of oil concentrations reveals a treatment more definable than those previously described in terms of volume ratios and produces lower lethal concentrations. Shrimp 96-h LC50 was 0.8 mg/l in this study as compared to values from 1.5 to 50 mg/l reported for other methods. Mean concentrations in tests do not give significant differences in concentration with respect to day of the test or spatial distribution in the exposure tanks. (Katz)

EFFECTS OF OIL POLLUTION ON BREEDING GREY SEALS,
West Wales Naturalist Trust, Haverfordwest (England).
J. E. Davis, and S. S. Anderson.
Marine Pollution Bulletin, Vol. 7 (6), June 1976, p 115-118, 5 tab, 1 fig, 10 ref.

Descriptors: *Oil, *Oil pollution, *Water pollution effects, Oil spills, Mammals, *Marine animals, Marine biology, Mortality, Growth rates, *Animal behavior, Environment, Social aspects, *Reproduction, Water pollution sources, Oil wastes
Identifiers: *Seals, *Grey seals, Wales, *Seal pups, Mothers, *Oiled seals, *Surival of seal pups

Marine mammals are probably frequently exposed to floating oil but little is known about the effects oil pollution has on them. Oil stranded on the shores in Pembrokeshire, West Wales in September 19 coincided with the start of the Grey Seal breeding season there. Observations have been made on the effect the oil had on the new born pups and their mothers. Behavior of oiled seals did not appear to differ from that of normal seals. Peak weights of oiled pups were significantly lower than those of unoiled pups but there is little point of cleaning individual animals. (Katz)

THE EFFECT OF DETERGENTS ON LARVAL DEVELOPMENT OF A CRAB,
K. Czyzewska
Marine Pollution Bulletin, Vol. 7, No. 6, June 1976, p. 108-112, 7 tab, 1 fig, 20 ref

Descriptors: **Crustaceans, Aquatic animals, *Crabs, *Commercial shellfish, *Toxicity, *Bioasssay, Laboratory animals, Larvae, Reproduction, *Synthetic detergents, Water pollution, Water pollution sources, Marine fish
Identifiers: Larval development, Anionic detergents, Non-ionic detrgents, Ethoxylate detergents, *Alkylate detergents, Crab larvae, Rhithropanopeus, Larval mortality, Detergent mixtures

The effect of a mixture of anionic (ethoxylate) and non-ionic (alkylate) detergents on development stages of the crab Rhithropanopeus from fresh embryogenesis to the Megalopa larval stage has been studied. Larval resistance increases with age. Larvae still in the eggshells are only slightly sensitive because of the thick and impermeable chorion. Low concentrations of detergents exert favourable effect, causing a decrease in larval mortality, but during moults there is an increase in mortality and a lengthening of the development period of the larvae. The mixture of detergents is more toxic than single detergents. (Katz)

TOXICITY OF CRUDE OILS AND A DISPERSANT TO THE STONY CORAL MADRACIS MIRABILIS,
Caraibisch Marien-Biologisch Instituut, Curacao (Netherlands, Antilles).
J. H. B. W. Elgershuizen, and H. A. M. deKruijf.
Marine Pollution Bulletin, Vol. 7(2), February 1976, p. 22-23.

Descriptors: *Oil wastes, *Oil pollution, Water pollution, *Benthic fauna, Coral, Invertebrates, *Marine animals, Atolls, Reefs, Detergents, Tropical regions, *Toxicity, Mortality, Bioassay.
Identifiers: Stony coral, Madracis mirabilis, Coral reefs, Dispersant, Leeward Islands, Chemical oil spill removers, Shell-dispersant LTX, Crude oil, Nigerian crude oil, Forcados crude oil, Tia Juana Pesada crude oil.

Coral reefs play a crucial role in the ecology of coastal tropical waters. In many areas they are now exposed to pollution hazards which have sometimes caused severe damage. Increasingly they are exposed to oil and, where clean-up methods are used, to dispersants. This report shows that the clean-up may be more damaging than the oil. (Katz)
W77-03196

EFFECTS OF CRUDE OIL ON AMERICAN LOBSTER (HOMARUS AMERICANUS) LARVAE IN THE LABORATORY,
Guelph Univ. (Ontario). Dept. of Zoology.
P. G. Wells, and J. B. Sprague.
Journal of the Fisheries Research Board of Canada, Vol. 33, No. 6, p. 1604-1614, 1976. 1 tab., 5 fig., 57 ref.

Descriptors: *Oil wastes, *Water pollution effects, *Lobster, *Larval growth stage, *Shellfish, *Lethal limit, *Toxicity, *Bioassay, *Larval, *Oily water, *Oil pollution, Animal behavior, Growth rates, Growth stages, Laboratory tests, Mortality, Commercial shellfish, Invertebrates, Methodology.
Identifiers: *Sublethal effects.

Four day LC50's for Venezuelan Tia Juana crude oil were 0.86 mg/liter for first-stage larvae of the American Lobster (Homarus americanus) and 4.9 mg/liter for third- and fourth-stage larvae. The 30-day LC50 was 0.14 mg/liter for larvae starting the test in their first stage. The threshold for retardation of larval development was about the same as the 30-day LC50. Decreased food consumption was demonstrated at 0.19 mg/liter. More 'intermediate' larvae developed in oil exposures but no threshold was estimated. The ratio of 'safe' to acutely lethal concentrations was about 0.03. Oil concentrations decreased during exposures; stated values could be multiplied by 0.59 to arrive at conventional average exposures. Aged dispersions were equally toxic. Post-larval lobsters dug significantly more burrows when the substrate contained oil but did not avoid oiled substrate, nor was growth or survival affected for substrates containing up to 1740 mg/liter of oil. (Katz)
W77-03197

EFFECTS ON FERTILIZATION AND DEVELOPMENT OF THE COMMON MUSSEL, MYTILUS EDULIS AFTER LONG-TERM EXPOSURE TO A NONIONIC SURFACTANT,
Kristinebergs Zoologiska Station (Sweden).
A. Granmo, and G. Jorgensen.
Marine Biology, Vol. 33, No. 1, p. 17-20, 1975. 2 fig., 8 ref.

Descriptors: *Mussels, *Surfactants, *Reproductions, *Water pollution effects, *Spawning, *Larval growth stage, *Larvae, Detergents, Environmental effects, Animal physiology, Invertebrates, Shellfish, Laboratory tests, Lethal limit.
Identifiers: *Sublethal effects.

Common mussels (Mytilus edulis L.) were exposed over a 5-month period to low-level concentrations (0.5 to 1.5 ppm) of a nonionic surfactant. Upon maturation at the end of this period, spawning ability was examined. Fertilization occurred at low-level concentrations (0.1 to 2.0 ppm) of the surfactant, and was most successful for gametes from the long-term controls and the highest long-term concentration (1.5 ppm). Inhibited or delayed larval development was observed, related to the concentration gradient of the short-term exposures. Gametes from mussels long-term exposed to the surfactant were more sensitive than those from the longterm control. (Katz)
W77-03198

DESTRUCTIVE GRAZING OF KELP BY SEA URCHINS IN EASTERN CANADA,
Dalhousie Univ., Halifax (Nova Scotia). Dept. of Biology.
P. A. Breen, and K. H. Mann.
Journal of the Fisheries Research Board of Canada, Vol. 33, No. 6, p. 1278-1283, June, 1976. 4 fig., 28 ref.

Descriptors: *Biological communities, *Food chains, *Kelps, *Primary productivity, *Algae, *Habitats, *Aquatic populations, *Plant populations, Aquatic plants, Crustaceans, Aquatic populations, On-site data collection, *Canada, Bays.
Identifiers: *Sea urchins, Laminaria, *St. Margaret's Bay(Nova Scotia).

Destruction of kelp beds by sea urchins has been documented in St. Margaret's Bay, Nova Scotia, and also appears to be taking place in other parts of eastern Canada. Continued sea urchin settlement onto grazed areas prevents the return of kelp and other algae for long periods. Because of the large contribution of kelp beds to coastal productivity, the disappearance of kelp from large areas is alarming. Dynamics of sea urchin grazing are discussed. (Katz)

EFFECT OF COPPER ON SOME ASPECTS OF THE BIOENERGETICS OF RAINBOW TROUT (SALMO GAIRDNERI),
Guelph Univ. (Ontario). Dept. of Zoology.
P. F. Lett, G. J. Farmer, and F. W. H. Beamish.
Journal of the Fisheries Research Board of Canada, Vol. 33, No. 6, p. 1335-1342, June, 1976. 4 fig, 2 tab., 22 ref.

Descriptors: *Copper, *Water pollution effects, *Growth rates, *Stress, *Rainbow trout, *Feeding rates, *Adaptation, *Heavy metals, *Digestion, Laboratory tests, Bioassay, Environmental effects, Trout, Diets, Fish physiology, Metabolism, Lethal limit.
Identifiers: *Sublethal effects.

The influence of sublethal concentrations of total copper on the appetite, growth, and proximate body composition of rainbow trout (Salmo gairdneri) held in hard water (365 mg/liter) was measured over a 40-day interval. The initial response of trout exposed to concentrations of copper ranging from 0.0 to 0.3 mg/liter (the 96-h LC50 was 0.25-0.68) was the cessation of feeding. Thereafter, food intake gradually returned to amounts observed for control fish, the rate of return of appetite being dependent on copper concentration and ration level. Growth rate of trout exposed to copper (0.075-0.225 mg/liter) and fed rations of either 0.25 or 1.5% dry food wt/wet fish wt per day was initially depressed but approached values observed for control fish near the end of the 40-day interval. During this period, lipid, protein, and moisture of fish exposed to copper did not change significantly. Initial growth retardation was not attributable to the inability of copper-exposed fish to digest their daily rations. Results are discussed in terms of the ability of fish to adapt to stress imposed by sublethal concentrations of heavy metals. (Katz)

EFFECTS OF CHRONIC DDT/DDE EXPOSURE ON ANESTHETIC INDUCTION AND RECOVERY TIMES IN RAINBOW TROUT (SALMO GAIRDNERI),
Fisheries and Marine Service, Winnipeg (Manitoba). Freshwater Inst.
J. F. Klaverkamp, W. L. Lockhar, D. Metner, and N. Grift.
Journal of the Fisheries Research Board of Canada, Vol 33, No 6, p. 1331-1334, June, 1976. 2 fig., 30 ref.

Descriptors: *Water pollution effects, *DDT, *DDE, *Bioassay, *Rainbow trout, *Mode of action, Animal physiology, Trout, Metabolism, Laboratory tests, Chlorinated hydrocarbon pesticides, *Lethal limit.
Identifiers: *Sublethal effects, *Phenoxyethanol, *M.S.222, *Anesthetics, *Chemical interactions.

In rainbow trout (Salmo gairdneri) fed pellets containing 4.55 microgram/gr of DDT and 6.81 microgram/gr DDE every other day, anesthetic induction and recovery times of phenoxyethanol (PE) were less than those in control fish. No interactions were observed in fish fed DDT/DDE and anesthetized with ethyl m-aminobenzoate methanesulphonate (M.S.222). Differences observed between fish fed DDT/DDE and anesthetized with PE as compared to M.S.222 could be due either to enhanced metabolism of PE or to the fact that PE and M.S.222 have different modes or sites of action. (Katz)

EFFECT OF TEMPERATURE AND SALINITY ON EXTENSION OF SIPHONS BY MERCENARIA MERCENARIA,
Oak Ridge National Lab., Tenn. Environmental Sciences Div.
W. VanWinkle, S. Y. Feng, and H. H. Haskin.
Journal of the Fisheries Research Board of Canada, Vol. 33, No. 7, p. 1540-1546, July, 1976. 3 tab., 4 fig., 9 ref.

Descriptors: Environmental effects, *Temperature, *Salinity, *Clams, *Commercial shellfish, *Water temperature, *Animal behavior, *Animal physiology, Analytical techniques, *Respiration, Invertebrates, Molluscs, Laboratory tests, Seasonal, Bioassay, Crustaceans, *Siphons.
Identifiers: Quahog clams.

Extension of siphons was used as a criterion of activity to examine the response of the quahog clam, Mercenaria mercenaria, to various combinations of test and acclimation temperatures and salinities. A quadratic regression model for the percentage of clams active as a function of the test temperature and salinity was assumed, and response surface contours for various percentages of activity were calculated and plotted. The regression model accounted for 72-88% of the observed variability in the 13 experiments considered. The contours are hyperbolic instead of elliptical for five of the experiments; no biologically meaningful estimates of the lower and upper temperature and salinity limits can be obtained in such cases. Low levels of activity, even at optimal T-S combinations, occurred during the summer. Some of the observed shifts in the position and shape of the temperature-salinity response surfaces were expected in light shifts in acclimation temperature or salinity. Other shifts in response surface could not be accounted for. The implications of these results for the purification of quahog clams harvested from polluted waters are discussed. (Katz)

M. Gordon, and M. E. Sisk.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-262 367, Price codes: A06 in paper copy, A01 in microfiche. Research Report No. 99, December 1976. 117 p, 39 fig, 14 tab, 51 ref. OWRT A-057-KY(1). 14-31-0001-4017. 14-31-0001-5017. 14-31-0001-6018.

Descriptors: Plankton, Benthos, Fish, Pollutants, *Kentucky, Productivity, Limnology, Lakes, Organic wastes, Phosphates, Nitrates, Dissolved oxygen, Hydrogen ion concentration, Phytoplankton, Standing crops.

This report describes research involving biological and chemical analysis of two undeveloped embayments on Kentucky Lake, namely Anderson and Vickers Bays. Field and laboratory studies were made to assess current biotic standing crops, limnological conditions and levels of inorganic and organic pollutants in the embayments. Levels of phosphates, nitrates, and organics are in low to moderate concentrations. The concentration of dissolved oxygen is not a limiting factor, since stress and/or death does not occur in aquatic life until the dissolved oxygen is below 4 ppm. T hydrogen ion concentration is between 5.0 and that has been established as not lethal to m freshwater fishes. Alkalinity is within the nor range for surface waters. Specific conductanc less than 100 micromhos, the maximum value most waters in Eastern United States. The t dissolved solid concentration derived fr specific conductance (100 to 200 ppm) is within range for most open basin lakes. Average mont total phytoplankton counts in the embayment dicate low to moderate levels of enrichment. B embayments are relatively free of gross orga and industrial pollutants. This survey provi established physical, chemical, and biological d which may be useful in detecting future change the environment before deleterious effects produced.

ORGANIC PHOSPHORUS IN LAKES,
Wisconsin Univ., Madison. Water Chemistry L
S. J. Eisenreich.
Available from the National Technical Infor tion Service, Springfield, VA 22161 as PB-262 4 Price codes: A11 in paper copy, A01 in microfic Ph.D. Thesis, 1976. 191 p, 31 fig, 18 tab, 82 OWRT B-088-WIS(1). 14-31-0001-4140.

Descriptors: *Phosphorus, *Lak *Eutrophication, *Algae, Chemicals, *Metals, ganic wastes, *Wisconsin, Phosphates, Analyt techniques.
Identifiers: *Organic phosphorus, Chemical tr ment, Alum, *Aluminum hydroxide, Inorga phosphorus.

The chemical factors controlling the removal particulate phosphorus (PP), organic phospho (Po) and inorganic phosphorus (Pi) from l waters by aluminum hydroxide have been vestigated. Aluminum hydroxide has large adso tion capacity for Pi in distilled and lake water vironments (250-280 micro-g P/mg Al). Optimu removals occurred at low (<4) and high pH (10), and were minimum in the pH range norm encountered in natural waters. The adsorption Pi and model Po species by amorphous Al-hyd ide was studied over the equilibrium concentra range of 8 x 10-7 to 1 x 10-4 M under normal l pH conditions using the Langmuir adsorp isotherm. The interactions of natural and mode compounds with aluminum hydroxide lead to belief that the fraction of native Po which is responsive to alum treatment consists o heterogeneous component formed by the asso tion of biologically-produced Po and native Pi v inorganic and organic matter in the lake water not identical to Po compounds normally isol from aquatic organisms. Solution composi cannot alone account for the lack of Po remo with alum. The non-responsive nature of the component is most likely a result of steric, st tural or localized ionic aberrations. The ultim success of lake rehabilitation by alum treatm depends primarily on three factors: (1) the ef tive immobilization of Pi and Po in the w column; (2) the inhibition of P regeneration f the sediments by covering with a layer of Al- and (3) the limitation of P inputs from exte sources. The lake should be treated at spring or overturn when Pi is the predominant P form achieve maximum P removals. A simpli method for the analysis of total P (TP), total solved P (TDP) and dissolved reactive P (DRP multiple water samples has been developed

BASELINE STUDY OF MICROBIAL ACTIVITY IN THE BEAUFORT SEA AND GULF OF ALASKA AND ANALYSIS OF CRUDE OIL DEGRADATION BY PSYCHROPHILIC BACTERIA,
Oregon State Univ., Corvallis. Dept. of Microbiology.
R. Y. Morita, and R. P. Griffiths.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Report for the Year Ending March 1976, Vol 10. Chemistry and Microbiology, p 147-191, April 1976. 12 fig, 9 tab. 03-5-022-68.

Descriptors: *Alaska, *Microbial degradation, *Oil spills, *Oil pollution, *Microorganisms, *Resources development, *Water pollution, *Baseline studies, *Environmental effects, Bacteria, Sediments, Biodegradation, Pollutant identification.
Identifiers: *Outer Continental Shelf, *Crude oils, Oil exploration, Oil development, Microbial activity, *Gulf of Alaska, *Beaufort Sea, *Psychrophilic bacteria, Desulfovibrio.

The levels of potential glutamic acid uptake observed in water samples taken from the Beaufort Sea were as high as those observed in other relatively productive marine waters. In both Barrow and Prudhoe Bay there were locations which consistantly showed higher levels of potential microbial activity. When the effects of incubation temperature on the maximum potential velocity of glutamic acid uptake was studied, it was found that there was a marked increase with increasing incubation temperature. Studies on the effects of melted ice water on heterotrophic potential data suggest that when melting ice water is released into the surrounding seawater, there is little effect on the observed microbial activity or the percent respiration. The acute effects of crude oil on the uptake and respiration of glutamic acid was studied by adding an aqueous crude oil extract to the reaction bottles used to determine heterotrophic potential. No consistant alteration in function was observed when the extract was added. Changes in the heterotrophic potential with time were studied in a natural microbial population exposed to crude oil using both labeled glutamic acid and acetate. In the initial stages of incubation, the levels of activity were lower in the crude oil enrichment but as incubation progressed, the levels of activity increased. Sulfate reducing bacteria appear to be very common in the inshore sediments of the Beaufort Sea. Psychrophilic crude oil degrading bacteria are probably quite rate in the waters of the Beaufort Sea. Of the 150 crude oil degrading bacterial strains isolated from this region, only three strains have a maximum growth temperature below 20C. Hence most of the bacteria degrading crude oil are probably psychrotrophic. (Sinha-OEIS)

Descriptors: *Alaska, *Oil pollution, *Copper, *Water pollution, *Oil spills, *Baseline studies, *Resources development, *Environmental effects, Sediments, Benthos.
Identifiers: *Outer Continental Shelf, Bering Sea, Trace metals.

This project is an investigation of the possible remobilization of trace metals from crude oil impacted sediments. The initial results of laboratory experiments suggest that the copper concentration of sediment pore water may increase following the addition of oil, and tentatively the effect is ascribed to the occlusion of trace metal binding or exchange sites by components of the oil. The primary activity of the study has been to follow the distribution and/or abundance of metals with time in small experimental containers to which oil has been added. Two principal analytical methodologies have been employed -- a radioisotope tracer technique and anodic stripping voltammetry. The initial results indicate a distinct but small increase in total dissolved copper following the addition of oil to water-sediment systems. Since the increase appears within twenty-four hours, the most likely but highly tentative conclusions is that the oil has occluded trace metal sorption/ion exchange sites on the sediment particles. EFFECTS OF SEASONABILITY AND VARIABILITY OF STREAMFLOW ON NEARSHORE COASTAL AREAS,
Alaska Univ., College. Inst. of Water Resources.
R. F. Carlson.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Year Ending March 1976, Vol 11. Physical Oceanography and Meteorology, p 23-73, April 1976. 10 fig, 4 tab, 15 ref. 03-5-022-56.

Descriptors: *Alaska, *Streamflow, *Oil spills, *Oil pollution, *Water pollution, *Baseline studies, *Resources development, *Environmental effects, Seasonal, Sediments, Leases.
Identifiers: *Outer Continental Shelf, Oil exploration, Oil development, *Petroleum resources, Near-shore processes.

An understanding of the seasonability and variability of streamflow is of considerable engineering importance to the imminent oil and gas develop-

ment. Streamflow variability, the effects of seasonal ice, as well as sediment characteristics and ice jam flooding have considerable impact on nearshore and estuarine areas. This is especially so in areas where sea ice remains intact after the initiation of river break-up. This occurs in nearly all rivers and streams in the North Bering, Chukchi, and Beaufort Seas, because the extensive areas of shorefast ice formed annually in these areas. The estuarine and shorefast areas are presently being developed and leased and this development is likely to continue throughout the O.C.S. program. In addition to the statistical characterization using standard hydrological methods, the following parameters are described for the 41 streams which have been gaged for varying periods of time: average period of break-up initiation (10 day period); average period of freeze-up (10 day period); miscellaneous break-up and freeze-up data; relative hypsometric curve for each basin; observations on past ice jam flooding; verbal description of annual flow variation; and use of original indices developed in this study to relate streamflow variability to basin characteristics and regional climate. BENTHOS-SEDIMENTARY SUBSTRATE INTERACTIONS,
Alaska Univ., College. Inst. of Marine Science.
C. M. Hoskin.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Year Ending March 1976, Vol 13. Geology, p 25-305, April 1976. 1 fig, 2 tab, 18 ref. 03-5-022-56.

Descriptors: *Alaska, *Benthos, *Oil pollution, *Water pollution effects, *Resources development, *Baseline studies, *Environmental effects, *Bottom sediments, Sediments.
Identifiers: *Outer Continental Shelf, *Petroleum resources, Oil exploration, Oil development, Substrates, *Bering Sea.

The overall goal of the work was to relate grainsize characteristics of bottom sediment to the distribution and abundance of benthos living in and on the sedimentary substrate. Because there are interactions between living benthos and their sedimentary substrate, perturbations in the physical or chemical nature of the substrate may cause perturbation in the distribution, species composition, and/or abundance of the benthos. Because the benthos, and man, are important parts of the food web in the Bering Sea, baseline data are needed to evaluate changes in the sedimentary substrate that could occur through exploitation of oil and gas resources. Identifiers: *Outer Continental Shelf, *Oil exploration, *Oil development, *Petroleum resources, Oil-ice interaction, Bering Sea, Beaufort Sea.

The purpose of the present study was to outline the various ways in which the sea ice of the Alaskan coast will entrain and interact with an oil spill or blow-out under the ice. The study concentrates on the small-scale properties of sea ice; namely, its salinity, temperature, and crystal structure, and is only indirectly concerned with the large scale transport and deformation of sea ice. The study divides into two parts: a laboratory experiment on ice growth in a wave field, which stimulates parts of the Bering Sea, and a field survey which consists of taking ice cores from the Beaufort Sea at different times of the year. In the laboratory experiment oil was injected under the growing ice to study the entrainment; in the field survey, cores were analyzed to see how oil might be entrained within them. (Sinha-OEIS)

tors: *Water pollution sources, *Waste ollution), *Public health, Waste water nt, Effluents, Recreation, Coliforms, Sal- , Aquatic bacteria, Sewage bacteria, Productivity, Phosphorus, Nitrogen, o River basin, Hoover Dam, Impound- *Nevada.
ers: *Lake Mead(Nev), Las Vegas(Nev), County(Nev), Las Vegas Bay(Nev), Beach(Nev), Las Vegas Wash(Nev).

Algae growths resulting from phosphorus and other nutrient discharges from the city and county sewage treatment plants at Las Vegas, Nevada is producing an objectionable aesthetic condition which, if allowed to continue unabated, will destroy the recreational value of the Las Vegas Bay area of Lake Mead in the Colorado River basin. To maintain algae counts of less than 2,000/ml throughout the area, sewage treatment plants should not discharge a concentration of more than 1.2 mg/l in their effluents. This standard would require 90-92% reductions in effluent phosphorus concentrations for the two sewage treatment plants. Excessive densities of coliform were discovered in the effluents of both sewage plants and salmonella in the Las Vegas city effluent and in the Las Vegas Wash region of the lake, indicating a need to improve chlorination facilities. However, coliform levels throughout Las Vegas Bay and in the Boulder Beach area are well below the levels of concern for direct contact water activities. At Boulder Beach, increased counts are the result of augmented bathing activity rather than pollution discharges from outside the area. Concentrations of metals and organic pesticides in the Las Vegas Bay area are both below levels of concern. (Harris-Wisconsin)

Descriptors: *Primary productivity, *Periphyton, Lakes, Biomass, Photosynthesis, Chlorophyta, Cladophora, *Eutrophication, Water pollution effects.
Identifiers: *Lake Jeziorak(Poland), *Lake Tynwald(Poland), *Oedogonio-Epithemietum litoralae, *Poland.

The association Oedogonio-Epithemietum litoralae, often found in eutrophic lakes in Northern Poland, was studied in Lake Jeziorak and Lake Tynwald. The association developed poorly in Lake Jeziorak, with a low percentage of green algae, a dominance of diatoms, and a regular expansion of bryozoa in summer. Assimilation of periphyton communities was estimated at an average of 0.88 kcal/sq m/day. A more detailed examination of periphyton primary productivity in Lake Tynwald resulted in the following conclusions: (1) Cladophora is a biennial component able to survive the winter and yield considerable amounts of biomass on last years reed stem in the spring, though a rather small production, (2) at the same time, populations of filamentous green algae appear on the new substrate supplied by the growing young reed blades, yielding a biomass of 10.9 kcal/sqm with a high production intensity, (3) the dominance of the filamentous green algae persists throughout the summer, constituting 92% of the total biomass, (4) in autumn, the external climatic conditions have a reducing effect on the production, and (5) the total increment or net production of organic substance produced by photosynthesis during the vegetative season was estimated to be 857 kcal/sqm, the coefficient P/B was 15, and the turnover was 16 days. THE PRIMARY PRODUCTION OF LAKE SIBAYA, KWAZULU, SOUTH AFRICA,
B. R. Allanson, and R. C. Hart.
In: Verhandlungen Internationale Vereinigung Limnologie, Vol. 19, Part II, p. 1426-1433, 1975. 6 fig., 1 tab., 6 ref.

Descriptors: *Photosynthesis, Aquatic algae, Productivity, Lakes, Africa, Tropical regions, *Primary productivity, Cycling nutrients, Eutrophication, Carbon, Waste assimilative capacity.
Identifiers: *Lake Sibaya(South Africa), Warm water lakes, Talling-Rodhe-Vollenweider model, *Carbon 14.

Carbon 14 uptake by the algal community of Lake Sibaya, South Africa was studied during 1973-1974, and the results were compared with studies of other warm water lakes. Carbon assimilation in Lake Sibaya, though showing a cool season depression, is largely light limited. The appearance of the photosynthetic rate curves with depth and season led to an attempt to use the Talling-Rodhe-Vollenweider model to fit the pelogic photosynthesis in response to light attenuation. A graphical solution, using Rodhe's methods is given, and confirms the adequacy of the model in determining the photosynthetic integral. The extinction of white light gave a closer fit to the observed value than the extinction of the most penetrating component in the lake, green light. It is concluded on the basis of these results, together with those of prior work, that Lake Sibaya behaves photosynthetically in a similar way to many other lakes. Comparison with other lakes show that Lake Sibaya has the lowest maximal productivity of tropical lakes so far studies. Results of the study are also considered with respect to Brylinsky and Mann's analysis of factors governing productivity in lakes and reservoirs. (Luedtke-Wisconsin)

LAKE PHOSPHORUS LOADING GRAPHS: AN ALTERNATIVE,
Environmental Protection Agency, Corvallis, Oreg. Eutrophication and Lake Restoration Branch.
D. P. Larsen, and H. T. Mercier.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-243 869, Price codes: A03 in paper copy, A01 in microfiche. Working Paper No. 174, July 1975. 30 p. 4 tab., 5 fig., 22 ref.

Descriptors: *Analytical techniques, *Trophic level, *Phosphorus, *Eutrophication, Oligotrophy, Lakes, Lake stages, Graphical analysis, Flow characteristics, Hydraulics, Model studies, Waste assimilative capacity.
Identifiers: *Phosphorus loading graphs, Phosphorus retention capacity, Phosphorus mass balance models, Hydraulic washout coefficient, Areal hydraulic load.

An improved analytical technique is described by which predictions can be made as to a lake's trophic state and changes in the trophic state caused by variations in the phosphorus level. The new technique is a graph of mean influent phosphorus concentration compared with phosphorus retention capacity, in which a relationship is expressed between phosphorus supply and hydraulic flow, on one hand, and the resultant trophic stae of lakes. The graph takes into account a relationship derived directly from the steady state solution of a simple phosphorus mass balance model, and predicts trophic state and

changes in trophic state caused by manipulating influent phosphorus concentrations and/or manipulating the assimilative capacity of a lake for phosphorus. The technique is intended as an alternative to phosphorus loading graphs, some of which have been developed from mass balance models that describe the relationship between lake phosphorus concentrations and the amount of phosphorus entering the lake. Empirical expressions are provided for use in studies of oligotrophic lakes, where predictions are to be made relating phosphorus retention capacity to areal hydraulic load or hydraulic washout coefficient. Identifiers: *New York Bight, Halocline, Pycnocline.

Initial results and analysis of an oceanographic and marine biological study of an 800 sq. mile area extending 15 miles offshore south of Long Island, New York--related to the proposed offshore siting of nuclear power plants--indicate: (1) the waters are generally well-mixed, isothermal, strongly driven by winds as well as tides, with typically highly-productive inshore marine biological communities; (2) despite extreme hydrological variability related to significant geographic differences in the study area, and taking into account anomalies in the vicinity of offshore dump sites, all biological communities follow a well-defined seasonal succession; (3) most of the chemical constituents show geographical as well as temporal variation, but ammonia was generally concentrated near the bottom; (4) Hudson River waters probably cause a pronounced halocline and pycnocline developed by late January in the northwest quadrant, and vertical gradients of salinity and density are apparent on all edges of the area by March; (5) nannoplankton predominates among the algal standing crop and primary productivity in November-December but is equally divided between net and nannoplankton by March, with larger diatoms assuming dominance; (6) zooplankton and fish eggs are minimal in January-February and most abudnant in March. Available from the National Technical Information Service, Springfield, VA 22161 as PB-245 131, Price codes: A19 in paper copy, A01 in microfiche. Report No. ASIS-01-75, Part I, October, 1970. 428 p. 106 fig., 44 tab., 710 ref., 1 append. 14-10-5-950-36.

Descriptors: *Barrier islands, *Census, *Maryland, *Virginia, Atlantic Ocean, Environmental effects, Sediment distribution, Currents(Water), Geology, National seashores, Coasts, Data collections, Dredging, Climatology, Primary productivity, Salt marshes, Tidal effects, Benthos, Fish populations, Crustaceans, Commercial fishing, Groundwater resources, Bibliographies, Ecology.
Identifiers: *Assateague Island, *Chincoteague Bay.

This report is a compilation of basic biological, geological, and ecological information for the area surrounding Assateague Island, and is intended along with Parts II and III to facilitate management of this barrier island seashore with particular reference to proposed dredging. The geological history, climatology, sea dynamics, and freshwater sources of the Island are described. Sedimentation distribution and yearly production rates of three major primary productivity sources in Chincototeague Bay, planktonic algae, underwater rooted aquatic plants, and spartina marshes were determined. Groups or communities of benthos in the Bay were identified and related to environmental parameters such as depth and sediment characteristics with particular attention given to the commercially important hardshelled clam. Chincoteague crustacea and fish populations were also surveyed. The development of the Chincoteague Bay commercial fishery in terms of catch records, fishing methods, laws, and research efforts are reviewed, and an extensive bibliography of natural, political, and historical aspects of Assateague Island and vicinity is included. Part II deals with the environment threats due to dredging, insect control and land disturbance, and Part III provides a suggested land use plan. (Luedtke-Wisconsin)

s of a study in which photoheterotrophic up-a southwestern Michigan hard-water lake ual to 67.6% of the chemoheterotrophic ac-on a comparative annual basis for the t period imply that research of trophic uptake utilizing dark techniques eriously underestimate total activity. The zone of Lawrence Lake underwent simul-s monitoring for uptake of glucose and for ithotrophic carbon fixation. Light and dark uptake of organic and inorganic carbon was red, revealing that light bottle uptake of or-naterial was significantly greater than dark uptake on the average. The patterns of the terotrophic activities demonstrate that the ses are separated in space and time on a as well as a seasonal basis. eterotrophic activity generally was skewed the morning and mid-day, with minating activity shifting to increasing in the water column as the day progressed. heterotrophic activity generally increased hout the daylight period and with depth. trophic fixation as compared with thotrophic carbon fixation indicates that eterotrophy may contribute significant ts of carbon to photosynthetic organisms conditions unfavorable to inorganic carbon n, such as low irradiance at depth and under er. e restoration program, dredging was used ve 62,000 cubic yards of silt from a 4.2 hec-a of Lake Herman, South Dakota during mers of 1970, 1971 and 1972. The silt was rted as slurry via pipeline to a deposit area t to the lake. Water removed by the process drained by gravity along a gradual slope, where it dropped its silt, lost its nutrients, then returned by pipe to the lake. Slurry water was rich in nutrients, particularly total phosphates. Orthophosphats, however, were uniformly lower in the slurry, in the deposit area, and in the return pipe than they were in the lake water at the point of dredging. Water from the deposit area was less basic and contained less nutrients than lake water, while an increase in vegetation occurred in the deposit site after deposition began. There was no significant change in organism or nutrient levels, except for phosphorus which increased shortly after dredging began. Hardness, silica and turbidity also increased. Core sampling revealed that recently deposited silt was much more fertile than earlier deposits. Greenhouse chrysanthemums grown in silt from the disposal site exhibited larger stems, leaves and flowers, but poorer root systems than those grown in commercial preparations. (Luedtke-Wisconsin)

METHODS OF DISSOLED OXYGEN BUDGET ANALYSIS FOR ASSESSING EFFECTS OF DREDGED MATERIAL DISPOSAL ON BIOLOGICAL COMMUNITY METABOLISM,
Virginia Univ., Charlottesville, Va.
G. M. Hornberger, and M. G. Kelly.
Available from the National Technical Information Service, Springfield, VA 22161 as ADA-018 340, Price codes: A05 in paper copy, A01 in microfiche. Report No. D-75-3, U.S. Army Engineer Waterways Experiment Station, November 1975. 98p, 3 fig, 6 tab, 19 ref, 4 append. DACW-39-74-C-0030.

Descriptors: *Methodology, *Aquatic productivity, *Dissolved oxygen, *Monitoring, Environmental effects, Computer programs, Mathematical studies, Fourier analysis, Data processing, Dredging.
Identifiers: Oxygen mass balance equation, Dredge disposal.

A method for automatically monitoring biological productivity and the dissolved oxygen budget of aquatic systems with the intent of detecting the biological effects of dredging and dredge disposal is described. Three computer programs for calculating a continuous function (a Fourier series) describing net community productivity using measurements of dissolved oxygen concentration, temperature, and salinity with a solution to the oxygen mass balance equation, were developed. These programs pertain to calculation of (1) temporal variation of net productivity in flowing water (rivers), (2) depth-averaged net productivity for a standing water body, and (3) the depth distribution of net productivity in standing waters. These methods are particularly suited for use with continuous automatic data recording systems, and can be used for assessing environmental effects of many engineering activities. Major assumptions in the development of the dissolved oxygen budget include a constant diffusion rate for the 24-hour period, night-time respiration similar to daytime respiration, one gram of biomass produced for each gram of oxygen released, no turbulent circulation patterns, and similar metabolic history of water entering and leaving an area. The required computer programs are presented and their use discussed. (Luedtke-Wisconsin)

HEAT INACTIVATION OF POLIOVIRUS IN WASTE WATER SLUDGE,
Sandia Labs., Albuquerque, N. Mex.
R. L. Ward, C. S. Ashley, and R. H. Moseley.
Applied and Environmental Microbiology, Vol 32, No 3, p 339-346, September, 1976. 3 fig, 5 tab, 20 ref.

Descriptors: *Waste water treatment, *Pollutant identification, *Heat, *Viruses, *Sludge, Anaerobic digestion, Waste dilution, Temperature.
Identifiers: *Poliovirus(Inactivation).

The study was designed to determine the effects of raw and anaerobically digested sludge on the rate of heat inactivation of poliovirus. Three types of poliovirus were grown and plaqued on a line of HeLa cells. A 10-fold dilution of virus was placed in the sludge samples at room temperature and then flamed to eliminate infectious virus that may have remained above the water line in the incubation bath. Then they were incubated at specified times and temperatures, placed in an ice bath and analyzed by the SDS-sonication procedure. Results showed that viruses are readily inactivated by heat, though the inactivation rate is most dependent on environment. Raw sludge proved consistently protective of poliovirus during heat treatment and digested sludge had erratic effects. The latter, when dilute and at low temperatures, protects the virus but, at high temperatures and concentrations, loss of viral plaque-forming units is more rapid. The difference between the two sludge types is attributed to the acquisition of virucidal activity during digestion. It seemed that a virucidal agent associated with the liquid component of sludge is produced during digestion. Solids of raw sludge are protective during heat inactivation, and this can be reversed by the addition of the liquid fraction of digested sludge. (Collins-FIRL)

RISK OF COMMUNICABLE DISEASE INFECTION ASSOCIATED WITH WASTE WATER IRRIGATION IN AGRICULTURAL SETTLEMENTS,
Hadassah Medical School, Jerusalem (Israel). Environmental Health Lab.
E. Katzenelson, I. Buium, and H. I. Shuval.
Science, Vol. 194, No. 4268, p 944-946, November, 1976. 1 fig, 1 tab, 7 ref.

Descriptors: *Waste water treatment, *Sewerage, *Pollutant identification, *Infection, *Human diseases, Waste water(Pollution), Irrigation practices, Irrigation water.

Statistics from 207 kibbutzim (population 82,825) were used to compare morbidity rates between users and nonusers of waste water for irrigation. Data was collected primarily for waterborne diseases such as shigellosis, salmonellosis (not including typhoid fever which was considered separately), infectious hepatitis, and influenza. Streptococcal infections (including scarlet fever) and tuberculosis were chosen as controls. Disease incidence was two to four times higher in settlements using sewage effluent as irrigation water. Though the incidence of clinical influenza was

twice as high in sewage-irrigated settlements, there was no difference in the incidence of laboratory diagnosed influenza cases. There was no significant difference in the incidence of the diseases not associated with sewage. Since sewage irrigation is not used during the winter, the similarity of mortality rates supports the hypothesis that there is a link between sewage irrigation and enteric disease incidence. Geographical differences and pathogen transmission by sewage-irrigated crops have been discounted. It was suggested that pathogens from waste water irrigation areas could reach kibbutz populations through alternate pathways, on bodies and clothes of irrigation workers returning to the community. The precaution of waste water treatment, including bacterial and viral disinfection of all waste water used in the vicinity of settlements or residential areas, is urged. (Collins-FIRL)

EUTROPHICATION AND RESTORATION OF LAKES RECEIVING NUTRIENTS FROM DIFFUSE SOURCES ONLY,
R. Pechlaner.
Verhandlungen Internationale Vereiningung Limnologie, Vol 19, Part II, p 1272-1278, 1975. 3 fig, 1 tab, 13 ref.

Descriptors: *Nutrient removal, *Water management(Applied), *Eutrophication, Water quality control, Artificial recharge, Foreign countries, Limnology, Recreation wastes, Water pollution sources, Europe, Oxygenation, Phosphorus, Lakes.
Identifiers: *Olszewski tubes, *Lake restoration, *Artificial aeration, Water restoration, Nonpoint-source pollution, Piburger See(Austria), Reither See(Austria), Hechtsee(Austria), Water renewal.

Whereas sewage diversion and other forms of lake sanitation are useful in efforts to reduce, stop or even reverse eutrophication, such prophylactic measures have little effect on nutrients that originate from nonpoint sources; in the latter case, priority must be given to lake restoration methods such as the artificial aeration by means of hypolimnetic outlets (Olszewski tubes). Lake restoration activities are described for three stratified recreational lakes in Tyrol, Austria which are characterized by some agricultural land use, sparse populations and intensive tourism. Olszewski tubes were installed at Piburger See, Reither See and Hechtsee. Secchi disc transparancy, oxygen stratification, phosphate concentrations, phytoplankton measurements, algae productivity and other eutrophication indices have been made before and after mounting of the Olszewski tubes. The tubes remove anaerobic water and with up to 300 micrograms per liter total phosphorus from the deepest part out of the lake. Efforts have been markedly successful in Piburger See and Reither See, but effects on lake stratification have not yet been observed in Hechtsee. (Harris-Wisconsin)

PHYTOPLANKTON RESPONSE TO PHOSPHORUS AND SILICA ENRICHMENTS IN LAKE MICHIGAN,
Michigan Univ., Ann Arbor. Great Lakes Research Div.
C. L. Schelske, M. S. Simmons, and L. E. Feldt.
Verhandlungen Internationale Vereiningung Limnologie, Vol 19, Part II, p 911-921, 1975. 3 fig, 7 tab, 13 ref. AEC C00-2003-24, NSF GA-4507.

Descriptors: *Lake Michigan, *Phytoplankton, *Nutrients, *Primary productivity, Phosphorus, Silica, Photosynthesis, Chlorophyll, Diatoms, Dominant organisms, Rivers, Eutrophication.
Identifiers: Muskegon River(Mich), Grand River(Mich), Kalamazoo River(Mich), St Joseph River(Mich).

Results of experiments made to study effects of small additions of phosphorus on natural Lake Michigan phytoplankton assemblages and the effects of silica and river water when combined with additions of phosphorus are described. Four locations were used along the southeastern shore of the lake, offshore near the Muskegon, Grand, Kalamazoo and St. Joseph rivers. Water pumped from the lake was treated with different combinations and levels of phosphorus, silica, and river water. The added phosphorus increased rates of carbon fixation and chlorophyll production, and in some experiments the same effect was achieved through addition of the silica and river water dilutions. In the Muskegon River experiment, phosphorus additions more than doubled the rate of carbon fixation and production of chlorophyll. Without added phosphorus there was no silica-induced effect, but river water increased the rate of carbon fixation more than two-fold. Somewhat similar results were obtained for phosphorus additions on carbon fixation and chlorophyll production in the other three stations, but greater variations were shown for the other experiments. The results confirm the conclusion that the sensitivity of Lake Michigan phytoplankton to small increases in nutrient loading is great. (Harris-Wisconsin)

LIMNOLOGICAL CHARACTERISTICS OF STRIP MINE PONDS IN NORTHWESTERN COLORADO, U.S.A.,
E. B. Reed.
Verhandlungen Internationale Vereiningung Limnologie, Vol 19, Part II, p 856-865, 1975. 10 fig, 6 ref.

Descriptors: *Strip mine lakes, *Food chains, *Fisheries, Strip mines, Rainbow trout, Ecosystems, Productivity, Fish establishment, Fish stocking, Fish management, Sport fishing, *Colorado.
Identifiers: Lake restoration, Water restoration.

Two Routt County, Colorado high-altitude strip mine ponds resulting from accumulation of water in surface excavation sites, were studied for two years to acquire water quality information anticipatory to establishing recreational fisheries. At Camilletti and Salamander Ponds, studies were made of physical, chemical and hydrobiological characteristics, including food web components. Salamander Pond's food web includes primary production of benthic algae and pondweed, detritus, insects and zooplankton, salamander and frogs, and water snake. The Camilletti food web is based on primary production of Chara, detritus, zooplankton, insects, snails, amphipods, and rainbow trout. In the Camilletti food web--unlike Salamander's--there was a distinct important link in the food chain that joins zooplankton production to higher-level production. Productivity in Salamander Pond could be improved by introducing a small number of catchable-size trout each spring. These would replace salamanders and water snakes at the apex of the food web in the pond. Temperature and oxygen conditions apparently permit rainbow trout survival in Camilletti Pond during the winter, but in Salamander Pond almost certain winter-kill means that a fishery could be maintained only on a put-and-take basis. atory study was conducted to evaluate soil nd depth of soil through which livestock percolate for a barriered landscape water ion system. Anaerobically treated dairy was applied to Matapeake silt loam, Sas- sandy loam, and Evesboro loamy sand in umns of 3, 5, 6 and 8 ft. lengths at loading 1.25 and 2.5 cm per day. In all soil columns osphorus was reduced from 44 mg/l to 0.5 less. Ammonia removal varied with soil hemical oxygen demand was reduced by 95 or more. Laboratory experiments were nducted to evaluate the changes in levels of cid soluble phosphorus in dairy manure during incubation. The incubated samples alyzed for dilute acid soluble phosphorus Troug 0.002N H2SO4 extraction procedure. regression analysis between the Troug orus values and the total phosphorus derived by summation of the raw material orus levels based on soil type showed that as a definite and characteristic rate of in- in Troug phosphorus with increasing of dairy manure slurry added. A barriered e water renovation system (BLWRS) was treating dairy cattle wastes. The BLWRS m x 9.1 m with a depth of 2.4 m. From June vember 31, 1974 the BLWRS reduced the l oxygen demand of the liquid dairy waste ercent or more, nitrogen by 85 percent or d ortho phosphorus by over 99 percent. 16

RY-BACTERIOLOGICAL STUDY OF FECTIVENESS OF DECONTAMINAT-

ING THE SEWAGE OF VOROSHILOVGRAD ON SEWAGE FARMS, (IN RUSSIAN),
Voroshilovgradskii Meditsinskii Institut (USSR).
M. F. Datsenko, and A. A. Loguda.
Gig Sanit 8, p 93-94, 1975.

Identifiers: *Shigellas, Ukrainian-Ssr, *USSR(Voroshilovgrad).

Industrial and domestic sewage used for irrigation on sewage forms after biological treatment is characterized by small bacterial numbers, low coli-index and presence of pathogenic microorganisms (salmonellas and shigellas). Application of sewage to soil changes the relationship of indicator microorganisms. Microorganisms of the Escherichia coli group accumulated and the soil biocenose changed on plots irrigated with sewage for 2 yr.--Copyright 1976, Biological Abstracts, Inc.

CHARACTERIZATION AND DEWATERABILITY OF WATER TREATMENT PLANT RESIDUES,
Missouri Univ., Columbia. Dept. of Civil Engineering.
J. T. Novak.
Reprint: Journal of the Environmental Engineering Division, ASCE, Vol 101, No EE1, Proc Paper 11111, February 1975. p. 1-14. 13 fig, 1 tab, 17 ref. OWRT A-061-MO(2), 14-31-0001-3825 and 4025.

Descriptors: *Dewatering, *Waste water treatment, Treatment facilities, *Sludge treatment, Design, Waste identification.
Identifiers: Sand beds, *Sludge characteristics.

An attempt was made to relate internal sludge characteristics to the design of sand beds for sludge dewatering. From the data collected in this study, it appears that sand beds can be a useful sludge dewatering method depending upon specific characteristics of the sludge. The most critical sludge characteristic with regard to the use of sand beds is sufficient compressibility to prevent bed penetration. Other characteristics governing sludge draining and drying rates are the sludge specific resistance and extent of dewatering (solids concentration) obtainable by draining. Since these same characteristics also govern the process yields by other mechanical dewatering methods (10) it can safely be generalized that a sludge which dewaters poorly by mechanical means will be limited in its rate of application to sand beds. These data do, however, provide a means by which sand bed sizing, and therefore cost, can be compared on an equitable basis with other dewatering methods so that optimal selection of a sludge dewatering method can be obtained.

UTILIZATION OF MUNICIPAL WASTE WATER FOR FROTH FLOTATION OF COPPER AND MOLYBDENUM SULFIDES,
Arizona Bureau of Mines, Tucson.
W. W. Fisher.
Arizona Bureau of Mines, Mineral Technology Branch, Circular 17, 1976. 17 p, 13 fig, 11 tab, 7 ref. $0.75. OWRT A-046-ARIZ(2). 14-34-0001-6003.

Descriptors: *Sewage effluents, *Waste water treatment, *Activated sludge, *Froth flotation, *Ion exchange, *Foam fractionation, Industrial water, *Sulfides.
Identifiers: *Municipal waste water, *Copper ore processing.

Secondary treated sewage effluent was substituted for normal process water in laboratory tests simulating froth flotation of copper sulfide ores. Flotation recovery of copper and molybdenum sulfides showed significant detrimental response to sewage effluent. First, a voluminous, difficultly controlled froth was generated, even in the absence of a frothing agent, that has little mineral carrying ability. Second, sewage effluent caused a small loss in copper recovery and a large loss in molybdenum recovery. The detrimental affects of sewage effluent on flotation were partially overcome by tertiary treatment of the effluent by activated carbon adsorption and anion exchange. The forthing problem was significantly reduced after treating the sewage effluent by foam fractionation. Dilution of the effluent with normal process water resulted in a significant improvement in metal recovery. In addition, the large loss in molybdenum recovery was overcome by using a secondary collector in a combination reagent schedule. However, the secondary collector caused an appreciable loss in copper recovery.

RENOVATION OF MUNICIPAL WASTEWATER FOR GROUNDWATER RECHARGE BY THE LIVING FILTER METHOD,
Pennsylvania State Univ., University Park. Inst. for Research on Land and Water Resources.
W. E. Sopper.
In: Biological Control of Water Pollution, p. 269-281, 1976. 11 tab. B-020-PA(17), B-047-PA(9), B-001-PA(13), B-069-PA(4), 14-01-0001-837.

Descriptors: *Sewage effluents, *Groundwater recharge, *Waste water treatment, Conservation, Soil filters, Irrigated lands, *Water reuse, Recycling.
Identifiers: *Renovation, *Municipal wastewater, *Cropland, *Forested areas, *Spray irrigation, *Land application.

Twelve years of research have indicated that the living filter system for renovation and conservation of municipal wastewater is feasible and that the combinations of agronomic and forested areas provide the greatest flexibility in operation. Such a system is more adaptable to small cities and suburbs than to large metropolitan areas because of the availability of open land close to the wastewater treatment plant, although the land area requirement is not a major prohibitive factor. At the recommended level of irrigation, 5 cm per week, only 52 hectares of land would be required to dispose of 4 million liters of wastewater per day. Although large contiguous blocks of agricultural and natural forest land would be the most desirable for efficiency and economy, major metropolitan areas could utilize golf courses, playing fields, forest preserves and parks, greenbelts, scenic parkways, and perhaps even divided highway and beltway medial strips. THE KINETICS OF ADSORPTION OF PHENOLS BY GRANULAR ACTIVATED CARBON,
Louisville Univ., Ky. Dept. of Environmental Engineering.
J. S. Zogorski, S. D. Faust, and J. H. Haas, Jr.
Journal of Colloid and Interface Science, Vol. 55, No. 2, May 1976, p 329 - 341. 9 fig, 5 tab, 9 ref. OWRT A-033-NJ(4), 14-01-0001-3830.

Descriptors: *Phenols, Water quality control, *Waste water treatment, *Activated carbon, Kinetics, *Adsorption.
Identifiers: Granular activated carbon, *Kinetics of adsorption.

The removal of phenols from aqueous solution via activated carbon adsorption is a feasible approach to diminishing the concentration of these contaminants in drinking waters. However, both the

kinetics of adsorption and the extent of adsorption at equilibrium are dependent on the physical and chemical characteristics of the adsorbate, adsorbent, and experimental system. Results of laboratory scale studies conducted to delineate the effect of such parameters on the kinetics of adsorption of phenols are reported. Parameters evaluated include: hydronium ion concentration, temperature, initial adsorbate concentration, size of adsorbent, competitive adsorption, and type of adsorbate. In addition, the nature of the rate limiting step in the adsorption process of phenols is described.

SUITABILITY OF LAGOON EFFLUENTS FOR IRRIGATION IN SOUTH DAKOTA,
South Dakota State Univ., Brookings. Dept. of Civil Engineering.
D. Odens.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-262 216, Price codes: A03 in paper copy, A01 in microfiche. Completion Report, September 1976. 42 p, 5 fig, 6 tab, 8 ref, append. OWRT A-052-SDAK(1). 14-34-0001-6043.

Descriptors: *Effluents, *Oxidation lagoons, *Irrigation water, Brackish water, Standards, Waste water disposal, *South Dakota, *Water quality standards, Waste water treatment, *Water reuse, Waste identification, Classification.

An evaluation and classification of lagoon effluents in South Dakota with respect to their suitability for irrigation and an estimate of the quality of water available was made. Lagoon waters from 20% of the total number of lagoons were sampled and analyzed during July and August. The water quality of the lagoon waters was compared to published water supply quality data for the respective water supply. From these comparisons, empirical relationships were developed permitting the prediction of lagoon water quality on the basis of published water quality data. Using these relationships, all lagoon waters were classified with respect to their suitability for irrigation. Estimates of volume of water available for irrigation was based on area of existing lagoons. Using tentative guidelines for waters suitable for irrigation developed by the Water Resources Institute, approximately 30% of the lagoons contain suitable water. Generally the sodium adsorption-ratio (SAR) was too high but in several instances where the SAR was acceptable the salinity as measured by conductance was unacceptable. The quantity of nitrogen was also evaluated. A mean value of 27 pounds of nitrogen per acre foot of water was found. (Wiersma-South Dakota)

A BUTANE FREEZING PROCESS FOR DEWATERING SLUDGE,
New York State Dept. of Environmental Conservation, Albany; and Virginia Polytechnic Inst. and State Univ., Blacksburg.
M. Z. Ali Khan, C. W. Randall, and N. T. Stephens.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-262 235, Price codes: A05 in paper copy, A01 in microfiche. Virginia Water Resources Research Center, Blacksburg, Bulletin 94, November 1976. 83 p, 36 fig, 8 tab, 41 ref. OWRT A-051-VA(1).

Descriptors: *Activated sludge, *Dewatering, Economic feasibility, Designcriteria, Filtration, Settling velocity, *Freezing, Waste water treatment, *Sludge treatment.
Identifiers: Gravity drainage, Specific resistance, Sludge conditioning, *Slurry freezing, Vacuum filtration, *Butane freezing process.

Utilizing butane as the refrigerant, the direct slurry freezing process was employed to condition waste activated sludge in order to improve subsequent dewatering. Using batch and continuous flow laboratory scale reactors, the process was evaluated from both a technical and economical standpoint. The sludge was placed in a closed reactor maintained at slightly less than atmospheric pressure, and liquid butane was bubbled through the sludge from a sparger at the bottom of the reactor. The boiling of the butane resulted in the formation of ice in the sludge but sufficient mixing was induced to prevent solid freezing. The sludge-ice slurry formed was removed, thawed and then dewatered using a variety of techniques. Recovery liquification and reuse of butane vapors, and the utilization of latent heat of fusion of the sludge-ice slurry to minimize requirements were evaluated to permit economic analysis. Reactor design requirements were determined. Waste sludges from five separate sources were obtained for experimental purposes. These sources included a municipal treatment plant, a highway reststop package plant, a small plant treating domestic waste from industrial employees, a plant treating pulp and paper waste, and laboratory scale aerobic digesters. Conditioning effectiveness was evaluated by gravity settling, vacuum filtration, and sandbed dewatering techniques. Both Buckner funnel and leaf test experiments, with and without chemical addition were used to evaluate filtration effectiveness. The results showed that the direct slurry freezing process using liquid normal butane as the refrigerant is an extremely effective method for conditioning waste activated sludge to promote settling concentration and dewatering. Furthermore, conditioning can be accomplished without the generation of a high strength supernatant. Important variables affecting slurry freeze conditioning are (1) the length of time the sludge is exposed to slurry freezing conditions; (2) the rate of freezing, which can be controlled by the butane flow rate; and (3) the total solids content of the mixed liquor being conditioned. Analysis and comparison of slurry freezing with other sludge conditioning techniques such as anaerobic digestion, heat treatment, chemical addition and indirect freezing indicate that slurry freeze conditioning produces superior results and can be operated more economically.

DYNAMIC RESPONSE OF FINAL SETTLING TANKS TO TRANSIENT LOADING CONDITIONS,
Delaware Univ., Newark. Dept. of Civil Engineering.
D. R. Pizarro.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-262 359, Price codes: A08 in paper copy, A01 in microfiche. Master of science thesis, June 1976. 141 p, 43 fig, 4 tab, 40 ref, 2 append. OWRT A-025-DEL(4).

Descriptors: Sedimentation, Sludge, Environmental engineering, *Waste water treatment, Suspended solids, Suspensions, Water pollution control, *Model studies, Activated sludge, *Simulation analysis, *Settling basins, Performance.
Identifiers: *Activated sludge process, *Clarification, *Final settling tanks, *Secondary settling tanks, Thickening.

The proposed dynamic model is based on the formation and propagation of concentration discontinuities constrained by the solids flux theory. The continuous thickener was divided into three regions: a uniform clarification zone, a uniform area intermediate region below the feed inlet and above the bottom zone, and a conically-shaped bottom zone for modeling purposes. Verification of the proposed model was accomplished by performing nonsteady state continuous thickening ex
ments using a calcium carbonate suspension. I
steady state operation was achieved by impo
step transients of the applied flux and the
derflow withdrawal rate on a continuous thick
previously maintained at steady state condit
A comparison of the model simulations an
laboratory data indicated that the concepts
ployed during the modeling provided a satisfa
description of dynamical conditions. (

astewater stabilization lagoons have been em-oyed in small communities where available land d favorable climatic conditions allow for utiliza-n as an economical secondary treatment ocess. Because of problems associated with the charge of algae in the effluent, the traditional goon may require either some process modifica-ns or additional effluent polishing processes in der to meet local water quality standards. The rpose of this study was to investigate the possi-ity of increasing attached algal growths on the rfaces of experimental biogrowth sheets to crease algal discharges and improve the removal iciency of organic materials as measured by emical Oxygen Demand (COD). The application biogrowth sheets was effective for the enhance-nt of lagoon stabilization capabilities with the lity to retain large microbial solids, or those h a size larger than the screen openings, from ng discharged. However, the practicability and sign characteristics of the lagoon modification h the application of biogrowth sheets should be aluated further with additional field investiga-ns.

MING FARMLAND WITH CALCIUM UDGE,
ssouri Univ., Columbia. Dept. of Civil En-eering.
J. Winburn.
ailable from the National Technical Informa-n Service, Springfield, VA 22161 as PB-262 221, ce codes: A05 in paper copy, A01 in microfiche. ster of Science Thesis, July 1976. 74 p, 10 fig, tab, 34 ref, append. OWRT B-113-MO(1). SDI-OWRT-14-34-0001-6093.

scriptors: *Sludge treatment, Lime, Missouri, Vaste water treatment, Farm management, ter reuse, Treatment facilities.
ntifiers: *Calcium sludge.

ne sludge from the Columbia, Missouri, Water eatment Plant was tested in soil columns to termine its usefulness as a liming material for d soils. Plexiglass cylinders (8.9 cm x 45. 7 cm g) were used as the soil columns. The soil was acid (pHs 4.4) Mexico silt loam. Two methods sludge application were used: (1) sludge was roughly mixed with the soil prior to being ced into the column, and (2) sludge was applied ectly on the soil surface. Loading rates of 2.02, 1, 6.61, 8.82, 11.02, and 13. 23g sludge/kg soil y solids basis) were used. Distilled water was ched through each column at a rate equivalent three years normal precipitation. Results in-ated that mixing the sludge with the soil oduced more uniform and greater levels of nge in pHs, exchangeable Ca, K, and P2O5 n the surface applied sludge. With the sludge-l mixture, a loading 4-6g sludge/kg soil (9-13 tric ton/ha) raised the soil pHs to 6.0-6.5, a ge considered optimum for crop production. sociated with this increase in pHs were in-ases of 58% in exchangeable P2O5, 79% in K l 100% in Ca. The surface spreading of the dge without incorporation into the soil appeared e undersirable as this method of application re-upon the slow process of water transport to in-porate sludge into the soil, producing an even distribution of sludge and a minimal ount of chemial correction in the soil. E ROTATING BIOLOGICAL FILTER,
w South Wales Univ., Kensington (Australia). hool of Civil Engineering.
Barnes, and F. Wilson.
ste Disposal and Water Management in Aus-ia, Vol. 3, No. 4, July-August 1976, p. 3-4, 7-8. g, 12 ref.

Descriptors: *Sewage treatment, *Biological treatment, *Treatment facilities, Reviews, *Waste water treatment, Water quality standards, *Filters, Filtration.
Identifiers: *Rotating biological filters.

The increasing stringency of effluent discharge standards in many parts of the world has led to a trend away from individual cesspools and septic tanks towards the use of small sewage treatment plants for community use. The rotating biological filter, which relies on biological treatment by micro-organisms growing on a rotating disc partly immersed in the sewage, satisfies most of the requirements for an ideal plant of this kind. The principles of operation, design criteria, applications and performance of this type of installation are reviewed. (CSIRO)

LAND BASED SEWAGE SLUDGE MANAGEMENT ALTERNATIVES FOR LOS ANGELES: EVALUATION AND COMPARISON,
California Univ., Los Angeles. School of Architecture and Urban Planning.
A. Herson.
June 1976. 127 p, 1 fig, 41 tab, 55 ref, 4 append. (California Water Resources Center Project UCAL-WRC-W-503).

Descriptors: *Waste water treatment, *Sludge disposal, *Municipal wastes, Sludge treatment, Economics, Water law, Irrigation, *California, Sewage sludge, Federal Water Pollution Control Act, *Recycling, Water reuse, Evaluation, Alternative planning, Alternative water use, Management.
Identifiers: *Los Angeles(Calif), Federal Water Pollution Control Act Amendments(1972).

The city of Los Angeles' Hyperion treatment plant currently discharges digested sludge via a seven-mile outfall to Santa Monica Bay. The EPA and the California State Water Resources Control Board have issued directives that ocean discharge of Hyperion sludge be discontinued by the end of 1976 unless the sludge is further treated to meet the discharge limitations established by the SWRCB's Ocean Plan. Since treatment to meet these discharge limitations appears economically infeasible, the city has begun examining alternative means of disposing Hyperion sludge on the land. Many of the negative effects of the agricultural alternative are attributable to the use of secondary effluent for irrigation water. Effluent transportation and disposal account for 58% of the capital costs and 85% of the operating costs of this alternative, and the electricity needed for pumping effluent accounts for almost all (94%) the energy required. Considerable attention should be given to development of alternative irrigation water supplies if sludge is to be applied on an Antelope Valley site. The high total costs of the agricultural alternative, rather than presenting a financing problem for the city, present a cost-effectiveness problem for the state and Federal governments whose grants would cover the additional costs. Much of the high cost of the agricultural alternative is attributable to the agricultural recycling of 55.2 mgd of secondary effluent, a feature not shared by the remaining alternatives.

SYSTEM FOR DEWATERING DILUTE SLURRIES,
Environmental Protection Agency, Washington, D. C.
T. Lippert.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-245 720, Price codes: A02 in paper copy, A01 in microfiche. (Patent Application), Seriesl No. 520.218, November, 1974. 16 p, 7 fig.

Descriptors: *Sludge treatment, *Dewatering, Equipment, *Design criteria, *Activated sludge, *Waste water treatment, Performance.

An improved system for dewatering dilute slurries such as waste activated sewage sludge is described which allows for higher solids yields by decreasing the solids loading which in turn allows for a proportionally larger decrease in the sludge-belt contact time to effect dewatering. The device includes a spring-loaded or balanced sludge feed tray incorporating an adjustable flow splitter plug along with spring-loaded sludge side guides. A sludge cake compression section design which allows two-position adjustment of the compression roller is employed as a component in the backflushing of the sludge carrier screen using cake effluent. Available from the National Technical Information Service, Springfield, VA 22161 as PB-250 672, Price codes: A17 in paper copy, A01 in microfiche. October 24, 1975. 375 p, 63 fig, 54 tab, 202 ref. Environmental Protection Agency Report No. EPA-905/9-76-003.

Descriptors: *Sewage treatment, *Sewers, *Treatment facilities, *Environmental effects, *Water quality, Land use, Interceptor sewers, Construction, Evaluation, *Ohio, *Waste water treatment.
Identifiers: Delaware County(Ohio).

An analysis of the environmental impact of a proposed sanitary sewage treatment facility and interceptor system for Delaware County, Ohio is presented. The environmental impacts of the sewage treatment facility at the chosen site are evaluated in terms of water quality, biology, land use, and aesthetics. The effects on water quality resulting from the proposed action are analyzed in terms of flow conditions, the waste loads introduced into the receiving stream, and existing and future ambient water quality conditions. Water quality problems of temporary duration which are associated with interceptor construction are also examined. (Kreager-FIRL)

CHLORINE DISINFECTION OF TREATED WASTEWATER IN A BAFFLED CONTACT CHAMBER AT LESS THAN 1 C,
National Environmental Research Center, College, Alaska. Arctic Environmental Research Lab.
R. C. Gordon, C. V. Davenport, and B. H. Reid.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-244 939, Price codes: A04 in paper copy, A01 in microfiche. Working Paper No. 21, October, 1973. 67 p, 11 fig, 7 tab, 35 ref.

Descriptors: *Disinfection, *Waste water treatment, *Chlorine, *Temperature, *Bacteria, Coliforms, Streptococcus, Effluents, Performance, Evaluation, *Chlorination.

The disinfection of treated waste water at temperatures in the 0-10 C range was studied. Batch treatment of one primary and three secondary effluents with chlorine revealed that effective disinfection was attained in all samples at a temperature of less than 1 C when the actual contact time was 60 min and the final chlorine residual was about 1 mg/liter (orthotolidine). Studies in an 8-compartment, 60-liter contact chamber with flow rates providing 30, 60, and 120 min theoretical contact time revealed that fecal coliforms were essentially destroyed (less than 5/100 milliliter) at temperatures of less than 1 C regardless of the flow rate or chlorine residual maintained. However, reduction of total coliforms to less than 1000/100 milliliter did not occur when the theoretical contact time was 30 min, even when the chlorine residual was 3.3 mg/liter (orthotolidine). For a theoretical contact time of 60 min, nearly 2 mg/liter chlorine residual were required before total coliforms were sufficiently reduced. Only slightly more than 0.5 mg/liter chlorine residual was required for sufficient reduction in total coliforms when the theoretical contact time was 120 min. Reductions in fecal streptococci were generally between those observed for total and fecal coliforms. Raising the temperature from 1 to 10 C did not significantly affect disinfection. (Freager-FIRL)

SHIP-TO-SHORE SEWAGE HOSE HANDLING TESTS,
Civil Engineering Lab. (Navy), Port Hueneme, Calif.
F. J. Campbell.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A017 692, Price codes: A05 in paper copy, A01 in microfiche. Technical Note N-1404, October, 1975. 98 p, 42 fig, 22 tab, 9 ref.

Descriptors: *Waste disposal, *Waste treatment, *Ships, *Transfer, *Design criteria, Evaluation, Performance, Equipment, Hoses.

Procedures and equipment for transferring waste from a ship's holding tank to pier waste-handling facilities were evaluated. The procedures tested included: loading, transporting, connecting, disconnecting, unloading, cleaning, and hose storing. The equipment tested included four types of transport vehicles, plastic and rubber hoses, metal and plastic hose caps and plugs, two powered reels, two types of storage and loading racks, a hose cleaning rack, a hose cleaning apron, and two types of hose supports. The systems selected as best suited to future sewage transfer operations included one for high- and low-load, high-turnover ports and a second for high- and low-load, low-turnover ports. Criteria for determining manpower and equipment requirements for the systems are outlined. (Kreager-FIRL)

ADVANCED TRICKLING FILTER FOR WASTEWATER TREATMENT,
Gary Aircraft Corp., San Antonio, Tex.
E. W. Leschber.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A018 318, Price codes: A03 in paper copy, A01 in microfiche. Air Force Report No. AFCEC-TR-75-6, August, 1975. 44 p, 13 fig, 4 tab, 3 ref.

Descriptors: *Trickling filters, *Tertiary treatment, *Waste water treatment, *Biological treatment, *Design criteria, Suspended solids, Biochemical oxygen demand, Equipment, Treatment facilities, Performance, Filtration.

A prototype advanced trickling filter unit for purifying secondary-treated waste water is described. The unit uses a foamed silica medium (GaryGlas) and has a design hydraulic load of 700,000 gallons/day. The design organic load (biochemical oxygen demand) and design solids load are 80 and 60 pounds/1000 cu ft/day, respectively. The unit is capable of reducing effluent biochemial oxtgen demand from 29 to 18 milligrams/liter, and reductions in total suspended solids from 64 to 32 milligrams/liter have been achieved. These reductions are sufficient for upgrading existing treatment plants to a level consistent with newer effluent limitations. Detailed design drawings of the trickling filter are provided. (Kreager-FIRL)

AMMONIA REMOVAL FROM WASTEWATER BY LIGAND EXCHANGE,
Gillette Co. Research Inst., Rockville, Md.
L. M. Smith, G. A. Lyerly, and M. E. Dooley.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-251 418. Price codes: A05 in paper copy, A01 in microfiche. Report EPA-600/2 - 76-103, April, 1976. 78 p, 21 fig, 13 tab, 27 ref.

Descriptors: *Waste water treatment, *Ion exchange, *Municipal wastes, *Ammonia, *Feasibility, Performance, Evaluation, Waste treatment, Chemical wastes, Alkalinity, Temperature.
Identifiers: *Ligand exchange.

A ligand exchanger consisting of copper ions on a hydrous zirconium oxide ion exchanger was tested in terms of its effectiveness in removing ammonia from secondary-treated municipal waste water and its regeneration capacity. Maximum ammonia uptake by the ligand exchanger occurred at a pH of 10-11 and corresponded to 0.1 millimole ammonia/millimole copper. Steam regeneration was temperature dependent, with maximum regeneration being complete after four column volumes of condensed steam at 135 C. Repeated loading ar regeneration through 25 cycles resulted in r physical particle breakdown nor copper leachin though some ammonia capacity was lost. Comm inorganics and organics exerted a minimal effe on the overall process. Runs with secondar treated waste water through five cycles were su cessful, with the exchanger capacity being ne that for pure ammonium chloride solution and e sentially no loss of capacity occurring. TECHNICAL ASSISTANCE PROJEC GREELEY WASTEWATER TREATMEN FACILITY, GREELEY, COLORADO. JUN JULY, 1972,
Environmental Protection Agency, Denver, Co Technical Support Branch.
Available from the National Technical Inform tion Service, Springfield, VA 22161 as PB-245 7 Price codes: A02 in paper copy, A01 in microfich Publication No. S and A/TSB-4, August, 1972. p, 5 fig.

Descriptors: *Waste water treatment, *Treatme facilities, *Activated sludge, *Biochemical oxyg demand, *Optimization, *Trickling filters, M nicipal wastes, Industrial wastes, Biological tre ment, Performance, Efficiencies, Sludge, Orga compounds
Identifiers: Solids bulking, Cross connections.

Improvements in the performance of an activat sludge/trickling filter waste water treatment pl handling municipal and industrial wastes in Greeley, Colorado area are outlined. Modifi tions to the facility resulted in an increase in 5-d biochemical oxygen demand removal from 40% 70%. Most of the improvement was due to discovery of a partially opened valve which p vided a cross-connection between the mixed liqu from the activated sludge plant and the final fluent. An improved operational mode for the tivated sludge portion of the plant also resulted better effluent quality. Wasting to the primar was optimized by monitoring the sludge blanket the primary clarifiers, and wasting was continu until the primary clarifier blankets began to crease to the point that bulking of solids from primaries would occur. Thus, all of the solids t could be handled by the system as well as all of biochemical oxygen demand that could be utili in solids production were removed. Consistent fluent quality is expected to be difficult to achi at the plant due to the organic overload receiv and the plant's inability to handle sludge soli (Kreager-FIRL)
W77-03368

DECONTAMINATION OF WATER CO TAMINATED WITH POLYCYCLIC AROMAT HYDROCARBONS (PAH). I. ACTION CHLORINE AND OZONE ON PAH DISSOLV IN DOUBLY DISTILLED AND IN DE-IONIZ WATER,
G. S. Sforzolini, A. Savino, S. Monarca, and M. Lollini.
Available from the National Technical Inform tion Service, Springfield, VA 22161 as ORNL 2960. Price codes: A02 in paper copy, A01 microfiche. Oak Ridge National Laborat Translation No. ORNL-tr-2960, 19 p, 11 tab, ref. Translated from Igiene Moderna, Vol. 66, 3, p 309-335, 1974.

Descriptors: *Water treatment, *Oxidati *Ozone, *Chlorine, Organic compounds, Che cal reactions, *Waste water treatment.
Identifiers: *Polycyclic aromatic hydrocarbo Pyrene, Benzoanthracene, Benzopyre Benzofluoroanthene.

The destructive effects of ozone and chlorine various polycyclic aromatic hydrocarbons bidistilled or deionized water were investigat

one proved to be more effective in destroying
ch compounds as pyrene, 1,2-benzoanthracene,
-benzopyrene, 3,4-benzofluoroanthene, and
12-benzofluoroanthene. Ozone in the form of
onized air at a concentration of 0.40 mg/liter and
h a contact time of 30 min produced stronger
structive effects than aqueous chlorine solu-
ns with a concentration of 2 mg/liter did over
same contact time. Ozone was most effective
inst 3,4-benzopyrene, with reductions amount-
to as much as 100%. Spectrophotometric
dence for the formation of new chloro deriva-
es of pyrene and 3,4-benzopyrene was observed
er their reaction with chlorine. Thus, ozone ap-
ars to be preferable to chlorine for the oxidation
polycyclic aromatic hydrocarbons in water.

FILTRATION/INFLOW IMPROVEMENTS IN
E OYSTER BAY SEWER DISTRICT,
lzmacher, McLendon and Murrell, Melville, N.

H. Albanese.
ter Pollution Control Federation Highlights,
l. 13, No. 9, p D1, D6-8, September, 1976. 2 fig.

scriptors: *Infiltration, *Inflow, *New York,
ewers, Programs, Public utility districts, Har-
rs, Topography.
ntifiers: *Infiltration/inflow.

e program used by the Oyster Bay Sewer Dis-
t of Long Island, New York, to correct their in-
ration/inflow problem was discussed. The area
composed of a low-lying harbor and hillier areas
he east, south, and west. The basic system was
nstructed in 1929 of clay pipe with tar and mor-
joints. The original plant was replaced by a
kling filter plant in 1965. In 1966, an infiltra-
n/inflow study was conducted which revealed
t the area had a structurally sound system
ich did not have to be entirely replaced to
uce infiltration/inflow. It was determined that
y 20-30% of the system needed repair and a
nber of significant leaks were repaired. A major
t water lake which discharged salt water into the
tem was discovered. A modified Phase I study
s done in 1974 which indicated that 20-30% of
system contained 75-80% of the total infiltra-
n/inflow. Pilot cleaning indicated that all
draulic cleaning equipment should have a
nimum flow of 227 liters per minute (60 gpm);
t sewers being cleaned should be less than one
arter full; that sand traps should be used in all
nholes downstream of lines being cleaned; that
avy sand deposits are best removed by bucket
machines; and that 'bee liners' should not be used. A pilot grouting program revealed that air testing of each joint is required in spring areas to prevent the spring from entering the sewer at an adjacent joint; that sealing joints in these areas tends to cause a buildup of ground water which appears as a leak in an adjacent manhole; and that sealing visible leaks under static groundwater conditions eliminates infiltration. (Collins-FIRL)

ACTIVATED SLUDGE WASTE WATER TREATMENT PROCESS - USING SUCCESSION OF AEROBIC AND ANAEROBIC ZONES TO REMOVE NITROGENOUS MATERIAL.
Belgian Patent BE-840-694. Issued April 13, 1976.
Derwent Belgian Patents Abstracts, Vol. X, No. 36, p D3, October 13, 1976.

Descriptors: *Patents, *Waste water treatment, *Activated sludge, *Nitrification, *Nitrogen compounds, Aerobic conditions, Anaerobic conditions, Biological treatment, Nitrates, Nitrites, Chemical reactions, Dissolved oxygen, Nitrogen.

A patent for an activated sludge waste water treatment process that uses a succession of aerobic and anaerobic zones to remove nitrogenous material is described. The process involves the following steps: waste water is mixed with activated sludge and a gas containing free oxygen under aerobic conditions (above 1 milligram/liter of dissolved oxygen); the liquor is then treated under anaerobic conditions (below 0.3 milligrams/liter of dissolved oxygen) to convert nitrates and/or nitrites formed in the aeration stage to nitrogen; the liquor is again treated under aerobic conditions, with part of the treated liquor being returned to the anaerobic stage; the liquor passes to a settling tank from which part of the settled activated sludge is returned to the initial aeration stage; and the purified decanted liquor is then discharged. Unlike prior art processes, the above scheme provides efficient nitrogen removal without either requiring multi liquid/solid separations or having an adverse effect on the rate of separation at the decantation stage. (Kreager-FIRL)

SCREENING APPARATUS FOR REMOVAL OF SOLIDS - FROM SEWAGE WITH ROTATING SCREEN AND VERTICAL LIFT FOR RESIDUES.
Belgian Patent BE-841-043. Issued April 23, 1976.
Derwent Belgian Patents Abstracts, Vol. X, No. 37, p D3, October 20, 1976.

Descriptors: *Patents, *Screens, *Waste water treatment, *Solid wastes, *Sewage treatment, Equipment, Design criteria, Separation techniques.

A patent for a screening device that removes solids from sewage or other waste waters is described. The device includes a first cylindrical screen with a vertical axis that is provided with slits or openings through which the liquid flows, with the solids in the liquid becoming deposited thereon and thus separated from the general flow. This screen is also provided with a scraper and can be fixed or rotated by a motor. A second screen located at the side of the first screen which rises above the upper level of the liquid flow is also provided. A lifting plate is associated with this second screen and is moved up and down by a hydraulic ram. When ascending, the plate collects all of the solid matter that has accumulated on the second screen. The solid matter is then pushed by a pressure head and associated piston into a compression chamber. The walls of the latter decrease in diameter towards the outlet, and a spring-loaded articulated plate assists in compressing the solid reject. Screening is continuous and effective. (Kreager-FIRL)

BIOLOGICAL TREATMENT OF SEWAGE WATERS - DEVICE WITH INTERNAL AERATION ZONE,
M. I. Buzovkin, D. D. Zhukov, and D. V. Ivanyukov.
Soviet Patent SU-497-245. Issued March 15, 1976.
Derwent Soviet Inventions Illustrated, Vol. X, No. 38, p D3, October 27, 1976. 1 fig.

Descriptors: *Patents, *Sewage treatment, *Activated sludge, *Aeration, *Waste water treatment, Biological treatment, Equipment, Design criteria, Liquid wastes.

A patent for an activated sludge sewage treatment device that has an internal aeration zone is described. The device consists of a horizontal cylindrical vessel with a coaxial inner cylinder which divides the unit into an outer circular aeration zone and an internal settling zone. The aeration zone with horizontal filtration mesh packing is provided with an inlet for compressed air and an outlet for the disposal of sludge into the settling zone. A round tray for distributing the feed sewage is also provided along with a circular tray for distributing the recirculated activated sludge. The system also has a separating partition and a central collecting tray. (Kreager-FIRL)
W77-03404

SLUDGE COLLECTOR AND LIGHT LIQUID SEPARATOR-FROM SEWAGE WITH TWO TANKS IN SINGLE HOUSING AND COVER.
Belgian Patent BE-841-045. Issued August 16, 1976. Derwent Belgian Patents Abstracts, Vol. X, No. 37, October, 1976.

Descriptors: *Patents, *Waste water treatment, *Sewage treatment, *Sludge treatment, *Sludge disposal, Recycling, Liquid wastes, Separation techniques.
Identifiers: Sludge collectors, Sludge separators.

A patent has been issued for a sludge collector. A unit containing this collector and separator is designed to separate settled materials and light liquids from waste water and sewage. Water flows into the unit and materials which can settle into the collector. The remaining liquid moves under the partition into the separator where materials such as oil and fats rise to the surface to be removed. Then, the water passes under a partition and out of the unit. Separate pipes are used to pump out collected sludge and light liquids. The collector and separator are washed by water after evacuation. (Collins-FIRL)

SEWERAGE TREATMENT APPARATUS,
Waters (Edward) and Sons, Melbourne (Australia). (Assignee).
R. N. Edwards.
Australian Patent 475,357. Issued August 19, 1976.
Official Journal of Patents, Trade Marks, and Designs, Vol. 46, No. 30, p 3029, August, 1976.

Descriptors: *Patents, *Sewage treatment, *Waste water treatment, *Design criteria, *Equipment, Oxidation, Chemical reactions, Color, Taste, Odor, Phenols.

A patent has been issued for a liquid sewage and waste treatment apparatus which provides biological and chemical oxidation and sterilization, and color, taste, odor, phenol, cyanide, and phosphate reduction of the contaminants. It is characterized by a high degree of oxygen absorption and utilization. The treatment apparatus is composed of an enclosed pressurized chamber with an upper and lower section. Liquid sewage enters the lower section, and oxygen is supplied to the upper one. The liquid sewage is directed in a stream into the upper portion where it is broken into small particles which absorb the oxygen as they drop through the oxygen rich atmosphere. (Collins-FIRL)
W77-03406

BIOLOGICAL PURIFICATION OF SEWAGE WATER-IN A MULTI-STAGE TREATMENT TANK WITH ROTATING CONTACTOR SURFACES PARTLY IMMERSED IN THE LIQUID.
German Patent DS 2407-423. Issued September 2, 1976. Derwent German Patents Abstracts, Vol. X, No. 37, p D2, October, 1976.

Descriptors: *Patents, *Sewage treatment, *Biological treatment, *Equipment, *Design criteria, Tanks, Liquid wastes, Operation, Treatment facilities, Waste water treatment.

A patent has been issued for a process and apparatus for biological purification of sewage water which features a multi-stage treatment tank with rotating contactor surfaces partly immersed in the liquid. The treatment unit should have a treatment basin/contact element surface area ratio about 0.0049 cu m/sq m. It should never be less than this. Under normal operating conditions, obtaining the optimum effect requires little effort. (Collins-FIRL)
W77-03407

COAGULATION CLARIFYING EFFLUENTS CONTAMINATED WITH COLLOID SUSPENSIONS-BY ELECTROPHORESIS AFTER MIXING IN INSOLUBLE METALLIC PARTICLES.
German Patent DS 2461-943. Issued September 9, 1976. Derwent German Patents Abstracts, Vol. X, No. 38, p D2-D3, October, 1976.

Descriptors: *Patents, *Waste water treatment, *Coagulation, *Electrophoresis, *Design criteria, Colloids, Mixing, Metals, Solids removal.

A patent has been issued for a process for coagulation clarifying effluents contaminated with colloid suspensions by electrophoresis following mixture with insoluble metallic particles. The plant for treating dirty water containing collids by electrophoresis has a suspension, coagulation, and separation zone. An electrode pipe containing electrodes is adjacent to a treating vessel with a cone-shaped upper section and a lower suspension area which is cylindrical and has a conical lower portion. A suction pipe valve, a pipe and a suspension pump connect the interior of the treating vessel to the lower end of the electrode pipe which is connected, by a pipe at its upper end, to the upper end of the separating area. Waste water enters through the tip of the lower conical area of the suspension zone and exits through an outlet at the upper end of the separating zone. (Collins-FIRL)
W77-03408

BIOLOGICAL CONVERTER FOR FAECAL MATTER IN WATER - USING ROTARY TUBES WITH FIBROUS FILLING SUPPORTING THE BACTERIAL CULTURE.
Netherlands Patent NL 7601-914. Issued August 31, 1976. Derwent Netherlands Patents Abstracts, Vol. X, No. 38, p D3, October, 1976.

Descriptors: *Patents, *Biological treatment, *Sewage treatment, *Biodegradation, *Design criteria, Water purification, Tanks, Waste water treatment, Recycling, Water reuse.
Identifiers: Fecal matter.

A patent has been issued for a system for the conversion of fecal matter in water to harmless matter by a biological culture. The major component is a conversion tank which houses perforated tubes. The tubes are on wheels which rotate to allow submersion and complete emergence. The tubes contain a water insoluble material with a large surface area, exposable to both water and air, for bacterial growth. Water which has been purified may be either re-used or released directly into waterways. The water quality is such that it may be used in fish farming or cattle watering. With some chlorination, it may be used as potable water. (Collins-FIRL)
W77-03409

CENTRIFUGE FOR DEWATERING SEWAGE SLUDGE.
Australian Patent 475,847. Issued September 2, 1976. Official Journal of Patents, Trade Marks and Designs, Vol. 46, No. 32, p 3240-3241, September 1976.

Descriptors: *Separation techniques, *Centrifugation, *Sewage sludge, *Dewatering, *Patents, *Waste water treatment, *Sewage treatment, *Sludge treatment, Equipment.

A patent has been granted for a centrifuge which drains off sewage sludge. The equipment includes a drum which is tapered towards both ends, a hollow shaft that extends longitudinally within the drum for the passage of sewage sludge, and means to withdraw separated water at one end of the drum and dewatered sludge at the other end. A conveyor screw passes through the drum's interior, along the whole length of the drum. Additionally, a rotatable ejection wheel with blades adapted to accelerate the sludge tangentially to the direction of the wheel is arranged within the drum. Thus, with a wheel in the interior of the drum, at or adjacent to the largest cross-section of the drum, the centrifuge operates and communicates with the interior of the hollow shaft for dewatering and discharging separated sewage. (Kramer-FIRL)
W77-03410

INTEGRAL CIRCULAR WASTEWATER TREATMENT PLANT.
Australian Patent 473,063. Issued June 10, 1976. Official Journal of Patents, Trade Marks and Designs, Vol. 46, No. 20, p 1968-1969, June, 1976.

Descriptors: *Waste water treatment, *Patents, *Activated sludge, *Treatment facilities, *Aeration, Aerobic treatment, Aerobic conditions, Oxygen.

A waste water treatment apparatus was patented. It has concentric circular inner and outer walls. The radius of the inner wall is between one quarter and seven tenths the radius of the outer wall. A radial partition extends across the intermediate volume joined to the outer and inner walls, spaced from the first radial partition to form a portion of the intermediate volume bounded by segments of the outer and inner walls from 90 degrees to 330 degrees and a second portion consisting of the remainder of the intermediate volume. There is an aeration zone within the outer wall outside the first arcuate portion, enclosed by a cover. Oxygen gas is introduced in the aeration zone. Another passage introduced activated sludge and feed waste water to the aeration zone. A second aeration zone outside the first arcuate portion is also enclosed by a cover. Oxygen depleted gas discharged from the first aeration zone is introduced to the second aeration zone and mixed with the oxygen-containing gas. A gas vent discharges further oxygen depleted gas from the second aeration zone. The second oxygenated liquor is also discharged from the second aeration zone. Oxygenated liquor is uniformly distributed in the first arcuate portion around the inner wall segments for radial flow across the first arcuate portion. A trough around the upper part of the outer wall segment of the first arcuate portion discharges clarified water. Activated sludge is collected and removed from the lower part of the first portion and at least part of it is returned to the passage to the first aeration zone. (Snyder-FIRL)

Identifiers: Methylamine, Amines, Chlorella py noidosa, Anacystis nidulans, Plectone boryanum.

The effects of ammonia on the growth a photosynthesis of axenic cultures of algae in high-rate sewage oxidation (stabilization) po were investigated. Ammonia at concentratio above 2.0 millimoles and at pH values over 8.0 hibited the growth and photosynthesis Scenedesmus obliquus, a dominant species high-rate oxidation ponds. Photosynthesis Chlorella pyrenoidosa, Anacystis nidulans, a Plectonema boryanum was also susceptible to a monia inhibition. Methylamine exerted the sa effect as ammonia, and its penetration into al cells was pH dependent. When operated at a 1 hour detention time, the high-rate oxidation po maintained a steady state with respect to al growth and oxygen concentration, and the conc tration of ammonia did not exceed 1.0 millimol Shifting the pond to a 48-hour detention caused increase in pond water ammonia concentration 2.5 millimoles, and the pond gradually turn anaerobic. Photosynthesis, which usually elevat the pH of pond water to 9.0-10.0, could proceed beyond a pH of 7.9 because of the hi concentration of ammonia. The dominant fact in determining the oxygen regime and growth r in oxidation ponds run at short detention tim thus appear to be ammonia concentration and p (Kreager-FIRL)

UDGE DEWATERING PILOT PLANT SIGN, PART I,
v Jersey Inst. of Tech., Trenton. Dept. of Civil Environmental Engineering.

P. N. Cheremisinoff, and M. A. Maglio, Jr.
Water and Sewage Works, Vol. 123, No. 11, p 90-95, November, 1976. 4 fig, 12 tab.

Descriptors: *Sludge treatment, *Industrial wastes, *Design criteria, *Pilot plants, Heat treatment, Dewatering, Treatment facilities, Chemical precipitation, Coagulation, Sludge disposal.
Identifiers: Chemical treatment.

Design considerations for a sludge dewatering plant were discussed in part one of a two-part article. First, the pilot plant was designed to handle secondary sludges as well as industrial sludges. Wide variations in sludge compositions at different plants and industries made this a necessity. Treatment stages included chemical treatment, heat treatment, and the dewatering process. The addition of chemicals such as lime to destroy pathogenic bacteria, and ferric chloride and ferrous sulfate to provide charge neutralization and coagulation was discussed. Heat treatment was considered as a means of improving sludge dewatering properties. Finally, a dewatering process was presented to deal with such factors as particle density, particle size, particle charge, degree of hydration, and compressibility. (Collins-FIRL)

DORR-OLIVER TO MARKET ECOLOTROL WASTE WATER TREATMENT PROCESS.
Chemical Engineering Progress, Vol. 72, No. 10, p 104, October, 1976.

Descriptors: *Waste water treatment, *Biological treatment, *Biochemical oxygen demand, *Activated sludge, *Nitrification, *Denitrification, Ammonia, Nitrogen, Microorganisms, Equipment.
Identifiers: Fluidized bed reactors.

A process which removes carbonaceous BOD (activated sludge), nitrifies ammonia nitrogen to nitrate form, and denitrifies nitrates to nitrogen was introduced. Fluidized bed reactors using microorganism-saturated media with high biomass concentration proved more economical than the more common concrete tanks or basins. The Hy-Flo system passes waste water up through a reactor partially filled with sand or a similar substance. After fluidization, the media becomes a vast surface on which microorganisms become attached. Biomass and biological reactions are like those of other biological treatment systems. In 15 min, 85-90% of carbonaceous BOD can be removed. Ninety percent nitrification is obtained in 18 minutes. Denitrification (99+%) can be achieved in 6 minutes. A pre-engineered equipment package will be developed for smaller plants. (Collins-FIRL)

HIGH GRADIENT MAGNETIC FILTRATION,
Sala Magnetics, Inc., Cambridge, Mass.
J. R. Harland, J. A. Oberteuffer, and D. J. Goldstein.
Chemical Engineering Progress, Vol. 72, No. 10, p 79-80, October, 1976. 1 fig, 2 tab, 7 ref.

Descriptors: *Waste water treatment, *Filtration, *Filters, Equipment, *Pilot plants, Sewage treatment, Economics, Costs, Operating costs, Waste treatment, Sewage treatment.
Identifiers: *Magnetic filtration.

Magnetic filtration may be used in waste treatment in two areas. First, it can directly filter suspended magnetic particles. The process may also remove non-magnetic materials by a seeding method. A simple high gradient magnetic separator is composed of a fibrous ferromagnetic packing or matrix filter bed which is externally magnetized. Economics of this method depend upon the form of the ferromagnetic matrix and the efficiency of the magnetic field. Contaminated material is passed through the filter and magnetic materials are trapped on the matrix fibers. In cases of non-magnetic suspended solids, a magnetic seed material, such as magnetite, is added to the water which is then flocculated to allow non-magnetic impurities to adhere to the seed material. Removal then occurs as with magnetic impurity removal. This technique has worked well in removing microbial cells and most viruses in treatment of raw sewage. Design features are given for a pilot plant and a total operating cost estimate of $0.10 to 0.15/1,000 gallons is given for a system which processes 27,000 gallons per minute of waste water. WASTE-TREATMENT 'FARM' HARVESTS FIRMS.
Chemical Week, Vol. 119, No. 11, p 51-52, September, 1976.

Descriptors: *Tertiary treatment, *Irrigation, *Municipal wastes, *Industrial wastes, *Waste water treatment, Aeration, Percolation, Biochemical oxygen demand, Nitrogen, Phosphorus, Odor, Pulp and paper industry, Economics, Fertilizers, Crop production, Michigan, Symbiosis, *Water reuse.

A waste water treatment farm that uses partially treated waste water to irrigate and fertilize 4500 acres of corn is described. Waste water is collected from industrial sources and 13 municipal systems and is piped for distances up to 11 miles to the site. After biological treatment (aeration and settling) and percolation through the soil, the treated water has a biochemical oxygen demand value of 2.7 ppm and phosphorus and nitrogen levels of 0.02 ppm and 2 ppm, respectively. During the winter, incoming waste water is stored in a 850-acre lagoon with over 5-billion gallon capacity. The return from the sale of crops at the farm is offsetting the treatment costs which are surprisingly low for tertiary treatment. Users are charged 22 cents/1000 gallons, with an additional 2 cents/1000 gallons in acreage assessments by municipalities. The main problem encountered with this waste water treatment farm which is located in Muskegon, Michigan is the generation of odor from paper mill wastes. (Kreager-FIRL)

USE OF SLUDGE LEFT AFTER WASTE WATER DECANTATION AS A FERTILIZER OR SOIL CONDITIONER (LES BOUES DE DECANTATION D EAU RESIDUAIRES UTILISEES COMME FERTILISANT OU COMME CONDITIONNEUR DE SOLS),
S. De Haan.
Bulletin d'Information, Institut Belge pour l'Amelioration de la Betterave-Tiene (Belgium), Vol. 11, No. 7, p 60-62, 1976. 1 tab.

Descriptors: *Waste water treatment, *Sludge disposal, Metals, Lime, Recycling.
Identifiers: Netherlands, Land application.

The average inhabitant in the Netherlands produces 60 cubic meters of waste water per year, containing 40 kg of solid organic matter and 30 kg of mineral material. Secondary (microbial) sludge contains large numbers of microorganisms, which are very rich in nitrogen and phosphorus. This sludge is customarily dephosphated with ferric chloride or aluminum sulfate and stabilized by addition of thickeners. After maturation for one year, moist sludge develops very favorable physical properties. It is then dewatered and preconditioned, and sterilized to destroy pathogenic organisms and worm eggs before agricultural or horticultural use. The effect of nitrogen is predominant for sludge in the first year of application, and

is generally positive. Undesirable effects of heavy metals can be avoided by addition of lime. Percolation water from sludge is heavily contaminated. It is recommended that not more than 2 tons of municipal sludge/ha/yr, calculated as dry weight, be added to soil. (Text in French) (Henson-FIRL)

SPECIFIC ROLE OF LIME IN MUNICIPAL WASTE WATER TREATMENT-EXPECTATIONS AND REALITY (DIE SPEZIFISCHE ROLLE DES KALKS IN DER KOMMUNALEN ABWASSERREINIGUNG-ERWARTUNGEN UND REALITAETEN),
R. Kickuth.
Forum Umwelt Hygiene, Vol. 27, No. 2, p 300-305, September, 1976. 2 fig, 1 tab, 13 ref.

Descriptors: *Waste water treatment, *Lime, *Municipal wastes, *Phosphates, *Water purification, Recycling.
Identifiers: Federal Republic of Germany.

Addition of lime directly to municipal waste water has been proposed for two distinct purposes: waste water purification and phosphate recovery. However, reaction of phosphate with lime can also be carried out in a separate process following precipitation with Fe or Al, and therefore, there is no compelling reason for the use of lime in the actual clarification process. Hydrolytic decomposition of iron and aluminum phosphates by lime would have to be carried out within the sludge loop of the municipal water system. Addition of lime to municipal clarified sludges containing iron phosphate to produce equilibrium pH values of 11 would result in 90-95% conversion of the iron-bound phosphate to usable calcium phosphate. A maximum of 2 g calcium hydroxide would be required for each gram of iron in the sludge, for an average addition level of 500 g calcium hydroxide per cubic meter of sludge. The sludge volume in a municipal sewage treatment system amounts to about 1% of the waste water volume, for a daily municipal clarified sludge volume of about 150,000 cubic meters in the Federal Republic of Germany. Therefore, about 27,375 tons of calcium hydroxide per annum would be required for the conversion of iron phosphates. (Text in French) (Henson-FIRL)

ORIGIN OF NITROGEN POLLUTION IN SURFACE AND WASTE WATERS (ORIGINES DES POLLUTIONS AZOTEES DANS LES EAUX SUPERFICIELLES ET LES EAUX USEES),
J. Bebin.
Techniques et Sciences Municipales--L'eau, 71(8/9):347-362, August/September, 1976. 11 fig, 13 tab, 18 ref.

Descriptors: *Nitrogen, *Pollution abatement, *Waste water treatment, *Sewage treatment, *Nitrification, Surface waters, Biochemical oxygen demand, Oxygenation, Water pollution control.

New developments are reported in the elimination of the problem of nitrogen pollution in both surface waters and waste waters. The nitrogen concentration has increased in surface waters over the past few years. The major sources of the increase are domestic sewage and industrial waste waters. Nitrogen pollution must be abated in sewage treatment plants, in order to avoid further eutrophication of rivers. Nitrification may be achieved quite simply by oxygenation, followed by the use of an anoxic tank. Sewage can then be used as a source of carbon, allowing both denitrification and further reductions in biochemical oxygen demand. (Kramer-FIRL)

ACTIVATED CARBON FROM ACTIVATED SLUDGE,
Technische Hogeschool Twente, Enschede (Netherlands). Dept. of Chemistry.
H. Bosch, G. J. Kleerebezem, and P. Mars.
Journal Water Pollution Control Federation, Vol. 48, No. 3, p 551-561, March, 1976. 5 fig, 2 tab, 21 ref.

Descriptors: *Activated carbon, *Activated sludge, *Adsorption, Oxidation, Filtration, Dewatering, Centrifugation, Pores, *Waste water treatment, *Biological treatment.

Investigations were conducted to determine if activated carbon with a sufficiently high surface area can be prepared from sludge; if this active carbon has necessary adsorption qualities; if the presence of carbon particles affects the rate and/or degree of biological oxidation; and if the active carbon acts as a filter aid in dewatering. Primary and secondary sludges were studied. The samples were centrifuged, dried, and the sludge carbonized in nitrogen gas. The samples were activated with steam. Pore structure, adsorption capacity, and the influence of active carbon on biological oxidation and floc structure in an activated sludge tank were investigated. This process facilitated regeneration of powdered carbon and the addition of commercial powdered carbon with a higher adsorption capacity may be beneficial. Adsorption is faster and more effective and an extra separator for carbon used in the tertiary purification is unneeded. Salts will be partly insoluble due to the regeneration procedure. (Collins-FIRL)

DESIGN AND CONTROL OF NITRIFYING ACTIVATED SLUDGE SYSTEMS,
Cornell Univ., Ithaca, N.Y. Dept. of Environmental Engineering.
A. W. Lawrence, and C. G. Brown.
Journal Water Pollution Control Federation, Vol. 48, No. 7, p 1779-1803, July, 1976. 13 fig, 8 tab, 20 ref, 1 append.

Descriptors: *Kinetics, *Nitrification, *Activated sludge, *Sludge treatment, Temperature, Oxygen demand, *Waste water treatment, Trickling filters.
Identifiers: Oxygen uptake.

A pilot study was conducted to determine criteria for the application of microbial growth kinetics and continuous-culture theory in the nitrification of activated sludge. A comparison of one- and two-sludge nitrifying systems was also made. This activity was done to aid the upgrading of a regional trickling filter plant in Cheektowaga, New York. Laboratory tests at 8 and 20C investigated temperature effects on nitrification; process stability against changing hydraulic, carbonaceous, and nitrogenous loads; and the use of biological SRT (sludge age) and controlled solids wasting. Steady-flow studies, reactor performance, settling characteristics, and microbial oxygen uptake, were considered. Experimental results indicated no essential differences in efficiency and performance of one- and two-sludge nitrifying systems operated under the same growth and temperature conditions; that nitrification can be controlled by applying biological solids retention time concepts and appropriate sludge-wasting policies; that nitrification is practically complete at temperatures of 8 and 20C with biological solids retention times of 20 and 10 days, respectively; and that maximum growth rates of nitrifying bacterial at 8 and 20C is approximately 0.25 and 0.5 days, respectively. Nitrification is definitely temperature dependent and use of either the one- or two-sludge systems should depend upon economic considerations. (Collins-FIRL)

CONCENTRIC WASTE-TREATMENT PLANT SAVES LAND, CUTS COST,
Stearns and Wheler, Cazenovia, N.Y.
S. G. Brisbin.
Civil Engineering-ASCE, Vol. 46, No. 2, p 74-76, February, 1976. 2 fig.

Descriptors: *Waste water treatment, *Biochemical oxygen demand, *Treatment facilities, *Waste treatment, *Land use, Landfills, Costs, New York, Weather, Aeration, Sludge disposal.
Identifiers: Imhoff treatment, Land application.

In 1969 the village of Camden, New York, located in the cold snow belt region immediately north of Oneida Lake, recognized that its waste water treatment facilities were inadequate and began planning the needed facility. The Village wanted a plant located near its existing Imhoff-type primary treatment plant that would be reliable, require a minimum of attention, be simple to operate, be compatible with the harsh winter conditions, be economical and easy to maintain. An extended aeration type process was selected, using three circular concentric tanks, the outer two for aeration and the central circle utilizing a covered final settling tank. It was designed to treat waste from an equivalent population of 4700, with an average flow of 800,000 gallons per day and a peak flow of two million gallons per day, and to provide 85% biochemical oxygen demand (BOD) and suspended solids reduction at average flow. The treatment process is relatively simple. Excess sludge is removed routinely from the system by pumping from the final clarifier to sludge holding and drying beds, then disposed of at a landfill or used as soil conditioner. Emergency generation equipment works automatically, when needed, to guarantee continued operation and treatment. Replacing portions of leaking sewers resulted in considerably reduced flows. Operating results indicate over 90% removals of all monitored pollutants. This plant cost only 60% of the cost of a conventional plant. (Snyder-FIRL)

THE ROTOR AERATOR: GROWING USE IN U.S. WASTE-TREATMENT PLANTS.
Civil Engineering-ASCE, Vol. 46, No. 2, p 76-77, February, 1976. 1 fig.

Descriptors: *Waste water treatment, *Sewage treatment, *Sewerage, *Treatment facilities, *Aeration, Aerobic treatment, Waste treatment, Aerobic conditions, Dissolved oxygen.
Identifiers: *Rotor aerators.

The rotor aerator was developed in the early 1950's as a low-cost method of sewage treatment. It has been used in sewage treatment plants ranging in size from 20,000 gpd to 40 mgd. In most cases, the rotor aerator is installed in an oxidation ditch with a race-track geometry. Using a ditch 10 to 16 ft deep was made possible by installing a baffle just downstream of the rotor aerator. When the aerated stream strikes the baffle, it plunges to the bottom of the ditch, then up again. Diffuser aerators have only about half the oxygen transfer efficiency of mechanical surface aerators. Turbine aerators have a more limited radius of influence than the rotor aerator. One-way movement around the oxidation ditch, with two rotor aerators 180 degrees apart, has an important advantage in nitrogen removal. The dissolved oxygen concentration tapers off downstream of the reactor. When it falls below 0.5 mg/liter, bacteria attack the nitrate ion, releasing both nitrogen and oxygen as a gas. (Snyder-FIRL)

method is illustrated that may be used to ac-unt for waste water carbon, nitrogen, and nosphorus and to specify the form in which each ay be found after treatment. In the activated udge process, the organic components of the aste are partially oxidized by microorganisms, ter which the microbial mass is separated as udge by settling from the supernatant liquid. The pernatant may undergo further treatment, and e concentrated microbial mass is recycled to the ration chamber. Once a waste water has been efined on a biokinetic basis, effluent quality, udge production, nitrification, and other parame-rs may be predicted based on the concept of ean cell residence time. A laboratory study is quired to define the biokinetic constants for car-n removal and nitrification to plot the forms of rbon, nitrogen, and phosphorus as a function of ean cell residence time as they appear after treat-ent. Determining the distribution of phosphorus a function of mean cell residence time is rela-ely simple, because phosphorus is either incor-rated into the sludge produced in the carbon moval and nitrification steps or it will pass rectly into the effluent. It is suggested that veral uses be made of the graphical relationships volved, the most important being a realization of at a process can or cannot do under a specific erating condition. It is suggested that elemental rcentage distribution diagrams may be easily termined for a specific waste water for a variety process operating conditions that may exist at a eatment plant. nominal 50-gpm pilot plant operated for about 15 onths using carbon treatment to remove soluble ganics from waste water. To quantify pertinent stem variables, periods of reasonably stable car-n system operation and performance were ntified by plotting effluent quality, carbon sage, and carbon system solids retention time r each day of pilot plant operation. The Freun-ch adsorption model is used to evaluate the ef-ct of treatment variables on carbon system sponse. Organic removal in the pilot plant car-n system is considerably higher than predicted adsorption by laboratory tests, reinforcing the esis that a removal mechanism in addition ex-ed in the carbon contactor. Treatment effects analyzed, including number of stages, chemi- pretreatment effects, biological effects, and eneration effects. In contrast to a previous dy, which indicated that adsorption and biologi- removal were operative in the first stage and edominantly adsorption removal in the second, sorption and biological removal apparently were erative in both stages. Because it is impossible model practically or predict theoretically carbon stem response, pilot plant studies for developing ing criteria for powdered carbon systems are ongly recommended. It seems that organic novals for two-stage counter-current treatment ng powdered carbon are higher than those for gle-stage treatment, but single-stage carbon treatment might be economically justified for relatively weak waste water. (Snyder-FIRL)

U. S. AIR FORCE GREENS COLORADO.
Water and Sewage Works, Vol 123, No 8, p 62-64, August, 1976. 7 fig.

Descriptors: *Waste water treatment, *Sewage treatment, *Sewerage, *Biochemical oxygen demand, *Treatment facilities, Colorado, Military reservations, Effluent, Recycling, *Water reuse.

Final polishing of effluent from the United States Air Force Academy's sewage treatment plant enables treated water to be recycled and used to irrigate the campus. Recycling water makes it possible to produce greenery unusual in this semi-arid region. Up to 20% of the wastes coming into the plant emanate from dining halls as garbage grindings, making the sewage twice as strong as what would normally appear in Coloado Springs. The plant uses primary sedimentation, industrial grit removal with full aeration, primary and secondary treatment filters, and intermediate clarifiers. Wastes are further purified in a four-stage reservoir system offering retention periods of 30 to 60 days and producing biochemical oxygen demand (BOD) that compares favorably with that of running streams. The water is used to irrigate lawns and shrubbery. Operation of the plant began in 1958. (Snyder-FIRL)

SHELTERS BOOST WINTER TREATMENT EFFICIENCIES,
Anderson-Nichols and Co., Inc., Boston, Mass.
L. W. Long.
Water and Sewage Works, Vol 123, No 8, p 32-33, August, 1976. 2 fig.

Descriptors: *Waste water treatment, *Sewage treatment, *Sewerage, *Treatment facilities, *Winter, Efficiencies, Materials, Maine.

Prefabricated, aluminum and fiberglass-plastic shelters around Mount Desert, Maine, sewage treatment facilities have resulted in a steadier demand in aeration requirements, energy savings, and less equipment wear in winter operation. All treatment plants on Mount Desert Island are of the secondary treatment type, utilizing extended aeration. The type of panels used in the shelters encourages heat from the sun to build up. At two plants, each made up of two aerator units, the seasonal load is sufficiently reduced in the winter that only one unit is needed, and only one was covered. Side wall panels are hinged so that they can be opened in summer for greater air circulation and maintenance. The steadier environment has resulted in less use of heaters. It is estimated that the energy savings alone could enable the shelters to pay for themselves. (Snyder-FIRL)

THE APPLICATION OF THE FOAM FRACTIONATION PROCESS TO THE REMOVAL OF VIRUSES. PART I. THE PRODUCTION OF A MATHEMATICAL MODEL TO PREDICT THE EFFICIENCY OF VIRUS REMOVAL,
Trent Polytechnic, Nottingham (England). Dept. of Life Sciences.
M. D. Guy, J. D. McIver, and M. J. Lewis.
Water Research, Vol 10, No 8, p 737-744, 1976. 2 fig, 3 tab, 4 ref.

Descriptors: Laboratory tests, *Waste water treatment, Analytical techniques, *Treatment facilities, *Foam fractionation, *Bacteriophage, Mathematical models, Efficiencies, Surfactants, *Viruses, Path of pollutants, Forecasting.
Identifiers: *Virus removal.

A laboratory scale foam fractionation plant was used to study factors affecting the removal of viruses. Viruses were represented by Escherichia coli Bacteriophage MS-2, and the surfactant was Arquad T50, a cationic agent composed of a blend alkyl quaternary ammonium chlorides. The level of Arquad T50 likely to be used in foam fractionation is toxic to Bacteriophage MS-2. If the water to be treated is mixed with the surfactant for a period before fractionation, the percentage of such bacteriophages that would be destroyed could be predicted mathematically. The removal of Enteroviruses with this cationic surfactant is not affected by toxicity. Virus removal depends on their adsorption to the surfactant and their physical removal as free virus particles entrapped in the interstitial liquid. (Snyder-FIRL)

EFFLUENT VARIABILITY ESTIMATION FOR COMPLETE-MIX ACTIVATED SLUDGE TREATMENT SYSTEMS,
Marquette Univ., Milwaukee, Wis. Dept. of Civil Engineering.
V. Novotny, A. J. Englande, Jr., and P. Majgani.
Water Research, Vol 10, No 8, p 699-709, 1976. 14 fig, 1 tab, 14 ref.

Descriptors: *Waste water treatment, *Biological treatment, *Activated sludge, Analytical techniques, *Treatment facilities, Effluents, Variability, Estimating, Mixing.

To meet effluent guidelines, it is necessary to quantitatively define activated sludge behavior with respect to transient loading conditions. A frequency transform technique was employed for developing mathematical models describing the waste water influent variability removal for completely-mixed biological treatment plants. The influent variability was simulated by a pulse function, a step function, a harmonic function, and a random signal. A principle of superposition can be applied for more complex influent variation patterns. The solution was presented for waste water treatment systems consisting of one mixed basin with decay or of two mixed basins, second with decay. A practical design equation was developed. Laboratory experiments were performed in an effort to verify the design equations. First, the steady state substrate removal coefficient was evaluated in a bench-scale study. Refinery waste water was used due to its relatively slow degradability. For random influent variation, input concentrations were changed at 2 hr intervals using a random number table. A pulse function was introduced by a 5 min application of a sample with 4200 mg/liter total organic carbon (TOC) followed by a return to the original 480 mg/liter TOC. A step function input was produced by a sudden 480 mg/liter increase in TOC concentration which was maintained. While some deviation from the theoretical model was indicated for random inputs, general agreement was within 5%. Both pulse and step function response showed excellent agreement with the theoretical equations, with observed error of 13 and 2%, respectively. (Snyder-FIRL)
W77-03434

BEHAVIOUR IN CONVENTIONAL SEWAGE PURIFICATION PROCESSES OF COLIFORM BACTERIA WITH TRANSFERABLE OR NON-TRANSFERABLE DRUG-RESISTANCE,
National Inst. for Water Research, Pretoria, South Africa.
W. O. K. Grabow, M. van Zyl, and O. W. Prozesky.
Water Research, Vol 10, No 8, p 717-723, 1976. 6 tab, 39 ref.

Descriptors: *Bacteria, *Waste water treatment, *Sewage treatment, *Biological treatment, *Sewerage, Analytical techniques, Treatment facilities, Filtration, Sedimentation, Sampling, E coli.
Identifiers: Drug-resistance.

The effect of biofiltration, sedimentation, chlorination, and sand filtration on coliform bacteria with transferable (R+) or nontransferable (R-) resistance to five common drugs was investigated. Grab samples were taken at a municipal sewage works after conventional primary sedimentation, biofiltration and secondary sedimentation, about 10 min after addition of chlorine to a total chlorine content of about 4 mg/liter, and after rapid sand filtration of the chlorinated effluent. The percentage of R- coliforms resistant to ampicillin (A), chloramphenicol (C), or streptomycin (S), but not kanamycin (K) or tetracycline (T) was slightly reduced. On the average the percentage of R+ coliforms resistant to one or more of these drugs was reduced by about 50%, mainly by biofiltration and sand filtration. The ratio of transferable to nontransferable resistance for drugs other than streptomycin increased during secondary sedimentation and chlorination. R factor transfer may occur in water. Rapid passage over stony surfaces in biological and sand filters is unfavorable for conjugation, while R factor transfer can be expected under the relatively stagnant conditions in sedimentation and chlorination tanks. The incidence of R factors conferring resistance to all five drugs simultaneously increased through treatment. The incidence of Escherichia coli I among R+ coliforms did not exceed 50%. The limited effect of conventional sewage purification on the incidence of drug resistance in bacteria supports the view that sewage should be treated by more advanced methods prior to discharge. (Snyder-FIRL)
W77-03435

CORRELATION BETWEEN BOD - TOC - TOD (ZUSAMMENHANG ZWISCHEN BSE5 - TOC - TOD),
K. Offhaus.
Vom Wasser, Vol. 46, p 35-63, 1976. 11 fig, 3 tab, 8 ref.

Descriptors: *Waste water treatment, *Pollutant identification, *Activated sludge, *Biochemical oxygen demand, *Chemical oxygen demand, Treatment facilities, Organic compounds, Carbon.
Identifiers: *Total organic carbon, Total oxygen demand.

Total organic carbon (TOC), biochemical oxygen demand (BOD), chemical oxygen demand (COD), and total oxygen demand (TOD) are important parameters for examining waste water. The difference in capacity for peptone degradation between a mixed culture and a Pseudomonas putida mono-culture is discussed in light of experiments performed. Using the effluent of a laboratory scale activated sludge plant, it can be demonstrated that Pseudomonas displays no stronger degradation capabilities than a mixed culture. The varying efficiency of the TOC and COD analysis, particularly with regard to carboxy-carbon, is mentioned. For oxidation of this type of carbon compounds, no external source of oxygen is provided which the carbon dioxide determines in TOC analysis. Extensive experiments indicate that in conventional COD determination nitrogen is not oxidized, in contrast with the TOD method with the Swing TOD analyzer where nitrogen is transformed into nitrous oxide. The correlations between COD, BOD, and TOC are discussed. The TOC value will, under certain conditions, allow BOD and COD to be rather precisely estimated. To reliably correlate BOD and TOC, numerous BOD determinations are required. (Snyder-FIRL)
W77-03436

SEWAGE PLANT FOR BRITISH VIRGIN ISLANDS.
Reinforced Plastics, Vol. 20, No. 5, p 138, May, 1976.

Descriptors: *Sewage treatment, *Treatment facilities, Plastics, Aeration, Scum, Bubbles, Construction, Activated sludge, Mixing, Equipment, *Waste water treatment.
Identifiers: *Virgin Islands(British), Glass fiber reinforced plastics.

A complete sewage treatment plant made of glass fiber reinforced plastics was designed for the Virgin Islands. The structure has the advantages of being corrosion resistant and light weight. It was designed to treat a 25,000 gpd dry weather flow of domestic sewage. The system consists of a GRP tank divided into an aeration chamber and an upward flow type settling chamber. A surface scum removal system avoids the problem of floating solids. Sewage enters the aeration chamber, is mixed with activated sludge, aerated, and transferred to the settling chamber. Solids from activated sludge settle to chamber base and return to the aeration chamber to be mixed with incoming sewage. Clarified effluent is discharged over a castellated weir. Air enters the aeration chamber through coarse bubble aerators. Construction is such that additional units can be added as needed. This system, for a population of under 500, is rectangular; a circular arrangement is recommended for populations of 800 or more. (Collins-FIRL)

SMALL VILLAGE GETS ADVANCED TREATMENT.
The American City and County, Vol. 91, No. 8, p 69, August, 1976.

Descriptors: *Tertiary treatment, *Treatment facilities, *Sewage treatment, Flow rates, *Filtration, Oxidation, Aerobic digestion, Biochemical oxygen demand, Suspended solids, Flocculation, *Waste water treatment, Pennsylvania, Aeration.
Identifiers: *Extended aeration, Phosphorus removal, Sand filters.

The new sewage treatment plant installed at the small village of McAlisterville, Pennsylvania, is an extended aeration plant. Due to the low flow rate of the receiving stream from April to October, 95% BOD removal is required. During the rest of the year, 90% BOD removal is achieved, meeting Pennsylvania's Department of Environmental Resources requirements. Design features include twin circular oxidation ditches with a common wall into which pumped wastes are discharged. The 'doughnut' is an oxidation ditch and the 'hole' is a clarifier, separated by a common wall. Rapid sand filters are used to further reduce BOD and suspended solids to the required levels. The sand filters have a top layer of coarse anthracite coal, a middle layer of common sand, and high-density garnet sand at the bottom. A chlorine contact tank provides chlorination and also serves as a reservoir for filter backwash water. Sludge is treated by aerobic digestion and land disposal. A chemical feed system is ready if phosphorus removal becomes necessary. Flocculation and tube settling mechanisms supplied with the sand filters can aid phosphorus removal. (Collins-FIRL)

BIOCHEMICAL MECHANISMS IN THE METHANE FERMENTATION OF GLUTAMIC AND OLEIC ACIDS,
Buck, Seifert and Jost, Englewood Cliffs, N. J.
C-N. Weng, and J. S. Jeris.
Water Research, Vol. 10, No. 1, p 9-18, 1976. 5 fig, 4 tab, 9 ref, 1 append.

Descriptors: *Anaerobic digestion, *Waste wate treatment, *Laboratory tests, *Methane, Radioac tivity, Chemical analysis, Chemical reactions, Fer mentation.
Identifiers: *Glutamic acid, *Oleic acid.

A series of 2-1 laboratory scale digesters fed on batch basis similar to typical field operations wer used to determine the biochemistry involved i anaerobic digestion processes used in waste wate treatment. L(+)-glutamic acid and oleic acid wer the substrates fed. Identifications were made b chemical analyses of the liquid feed and effluen and radioactivity analyses of the gases produce was by liquid scintillation techniques. It was con cluded that glutamic acid was probably degrade to methane and carbon dioxide throug mesaconic, pyruvic, lactic, propionic, and aceti acids. Beta-oxidation seemed to be the majo mechanism in oleic acid fermentation. The majo volatile acid intermediate found in methane fer mentation of L(+)-glutamic and oleic acids wa acetic acid. LARGE SCALE SEWAGE TREATMENT PLAN WITH SLUDGE INCINERATOR.
Chemical Age of India, Vol. 27, No. 7, p 651-65 July, 1976.

Descriptors: *Waste water treatment, *Sewag treatment, *Biological treatment, *Sewerag *Treatment facilities, Sludge, Sludge disposal, I cineration.

The treatment process of a large industrial sewag treatment plant was described. The plant, locate at the Grenzach Work of Ciba-Geigy AG, Base Switzerland, treats wastes from the production dyestuffs, textile auxiliaries, and industrial chem cals as well as municipal sewage from nearly con munities. Major plant sections are a chemica physical section, clarifying section, biological se tion, sludge and waste incinerator section. Chem cal works effluent is pretreated in the chemica physical section. The effluent has a high salt co tent, acidic pH, residual solvents, non-ferro metals, and other organic substances which inhib biological decomposition. This section contai the acidic flocculation and flotation stage, the a kaline flocculation and sedimentation stage and buffer basin. Municipal sewage is pretreated in th mechanical clarifier parallel to the industrial e fluent treatment line. A mixture of both is fed to distributor basin. Biological treatment consists aeration, deaeration and secondary settling. Th return sludge is recirculated and the cleane sewage is fed into the Rhine river. The sludge dewatered and burned in a fluidized-bed furnac and the ash (6 cu m per day) containing no mo than 1% organic matter is hauled to a dump. Th plant also contains a refuse incinerator whic burns all kinds of industrial wastes. (Collins-FIRL

COMPARISON OF AIR AND OXYGEN AC TIVATED SLUDGE SYSTEMS,
Camp Dresser and McKee, Inc., Boston, Mass.
A. A. Kalinske.
Journal Water Pollution Control Federation, Vo 48, No. 11, p 2472-2485, November, 1976. 2 fig, tab, 57 ref.

Descriptors: *Waste water treatment, *Biologic treatment, *Activated sludge, *Biochemical o ygen demand, *Air, *Oxygen, Dissolved oxyge Metabolism.

A study to determine the reality of claims made f oxygen activated sludge systems was conducte It was claimed that elevated DO caused bas changes in the metabolic activity and chara teristics of organisms composing an activate sludge floc; that flocculant suspension settles at higher velocity for any given concentration such flocculant biomass; that an elevated D

uces microbial cell growth or synthesis will be
uced for the removal of a given amount of or-
ic substrate or BOD; and that an elevated DO
mits a higher bio-oxidation rate and higher
D loadings for equal BOD removals. Results in-
ated that for most physical and biochemical
ameters, both systems were comparable. An
ated DO above 2 mg/liter had no influence. A
er mixed liquor pH may cause some inhibition
itrification at lower temperatures in oxygen
ems. Oxygen systems can supply a high ox-
n input needed for high strength wastes for
ch air systems need increased mixing intensity.
her DO levels possible with oxygen systems
vide a short period reservoir of oxygen when
ake increases, but if this uptake lasts, DO
els will drop to zero if supply does not match
and. But this is true for all systems. With
itoring and automation, both systems can per-
n equally in this respect. In large plants, costs
relatively equal. There is no basis for the as-
ption that oxygen systems demand less power.

ntifiers: Food to microorganism ratio.

study was conducted to compare and clarify flicting claims made for the oxygen and air ac-ted sludge processes. The activity of DO was lied by consideration of the effects of cromixing and micromixing on activated sludge size, substrate concentration, F:M ratio, and penetration. It was found that oxygen ac-ted sludge required higher DO levels to main- floc penetration of DO than air activated dge. Oxygen systems can be designed at higher l levels than air systems. However, oxygen tems had a better ability to cope with unex-ted increases in organic loading. The systems e proved equal in operation when a minimum of 2.0 mg/liter was maintained in regard to set-bility. The previously mentioned minimum DO ured an equal sludge production for most mu-pal waste waters. DO control in air activated tems is no more costly or difficult on an annual is than in an oxygen activated system. The ox-n activated system has produced high per-nance standards which only well-designed and rated air systems can compete with. The ox-n system is best applied in situations where ce limitations occur, where there is a side load tuation, or when strong municipal or industrial te waters are treated. (Collins-FIRL)

TRAVIOLET DISINFECTION: AN ALTER-TIVE TO CHLORINATION,
nada Centre for Inland Waters, Burlington tario).
G. Oliver, and J. H. Carey.
rnal Water Pollution Control Federation, Vol. No. 11, p 2619-2624, November, 1976. 2 fig, 6 16 ref.

scriptors: *Waste water treatment, *Activated lge, *Treatment facilities, *Ultraviolet radia-, *Disinfection, Chlorination, Waste er(Pollution), Toxicity.
ntifiers: *Ultraviolet disinfection.

ause chlorine residues are toxic to aquatic life, disinfection of waste water was studied. This one with a UV wavelength of about 254 nm. It not become popular because chlorine was cheaper and provided some degree of residual protection. Major problems encountered with UV disinfection were: the need to maintain residual protection from bacterial contamination during transport and the difficulty of obtaining totally sterile water from a raw water supply with variable turbidity and color. Studies have shown that 99% of total coliform, fecal coliform and fecal streptococcus could be killed with low doses, that bacterial kill was independent of light intensity, and that ultrasonic pretreatment produces a higher bacterial kill. Experiments were conducted with UV lights over secondary clarifiers in an activated sludge plant. This indicated that total coliform and fecal streptococcus are less sensitive to UV light than fecal coliform bacteria. All pathogens and viruses studied were as sensitive or more sensitive to UV light than fecal coliforms. Problems encountered were large surface areas of clarifiers which altered effluent residence time near the surface and the variable flow rate at waste water treatment plants. Flat weirs on final clarifiers are necessary before UV disinfection is practical. This method would also suppress algae growth on the weirs. Its major advantage is that it is less harmful to the environment than chlorination, though chlorine is cheaper. (Collins-FIRL)

FLOW EQUALIZATION BY USE OF AERATION TANK VOLUME,
Drexel Univ., Philadelphia, Pa. Dept. of Environmental Engineering.
R. E. Speece, and M. LaGrega.
Journal Water Pollution Control Federation, Vol 48, No 11, p 2599-2608, November, 1976. 8 fig, 8 ref.

Descriptors: *Waste water treatment, *Biological treatment, *Biochemical oxygen demand, *Treatment facilities, Flow, *Flow control, Flow rates, Aeration.
Identifiers: Flow equalization.

Flow equalization was examined as a method for producing waste treatment effluent with a better average quality. It was expected that this process would improve overall treatment efficiencies, extend plant design life, reduce operating costs, and reduce waste water quantities by-passed. Economic advantages of the system were not clear. However, a study showed that a separate upstream equalization basin is more costly than basing design overflow rates for the clarifiers on the peak rather than average flow. There was a definite relationship between overflow and suspended solids in the effluent. A reduction in effluent was accompanied with a reduced BOD. Several methods were tried in flow equalization, such as basins to equalize raw flow before reaching treatment plant; some waste water flows were equalized to provide uniform 24-hr discharge to anaerobic contact processes; and some industries store a 24-hr waste water flow, check it for toxicity and then discharge it to a biological treatment unit. Aeration tank volume has been used for equalization purposes and oxygen transfer has also been a consideration in the process. Other considerations discussed were the probability of overflow, concentration equalization, soluble BOD removal, location of equalization systems in the flow scheme, and regulatory approval. VIRUS AND BACTERIAL REMOVAL FROM WASTE WATER BY LAND TREATMENT,
Agricultural Research Service, Pheonix, Ariz. Water Conservation Lab.
R. G. Gilbert, C. P. Gerba, R. C. Rice, H. Bouwer, and C. Wallis.
Applied and Environmental Microbiology, Vol 32, No 3, p 333-338, September, 1976. 1 fig, 5 tab, 19 ref.

Descriptors: *Waste water treatment, *Sewage treatment, *Pollutant identification, *Viruses, *Sewage bacteria, Coliforms, Streptococcus, Salmonella.
Identifiers: *Virus removal, *Bacterial removal.

This study was conducted to evaluate the effective removal of viruses and bacteria from secondary sewage effluent and to evaluate their movement in soil during flooding. Results indicated that fecal coliforms, fecal streptococci, and total bacteria were decreased about 99.9% in renovated well water and Salmonella were not found in 5 liter well water samples from the east center well at two samplings. There were no detectable viruses in the well water which indicated that 99.99% of them were removed during percolation of waste water through 9 m of sandy loam soil. Sewage effluent samples contained poliovirus types 2 and 3, echovirus 7 and 15, coxsackiervirus B4, and reovirus types 1 and 2, which varied with the time of year. It was proved that human bacterial and viral pathogens were mostly removed from sewage effluent when it percolates through the soil. After eight years of operation, the project showed that viruses, enteric bacterial pathogens, and pollution indicator organisms in renovated sewage effluent were very decreased or nondetectable after filtering waste water through soil recharge basins. Land treatment was shown to be a very satisfactory method of waste water renovation. Studies on the detection and assessment of the survival potential of virus populations retained in the soil should be undertaken. (Collins-FIRL)

AN OPERATOR'S APPROACH TO AEROBIC DIGESTER SUPERNATANT DISPOSAL PROBLEMS,
Montgomery County Sewer Authority, Oaks, Pa.
R. G. Fricker.
Water Pollution Control Federation Highlights, Vol 13, No 10, p D2-D3, October, 1976.

Descriptors: *Waste water treatment, *Pollutant identification, *Biochemical oxygen demand, *Treatment facilities, *Digestion, *Aerobic treatment, Waste disposal, Anaerobic digestion.
Identifiers: *Aerobic digestion.

Problems associated with aerobic and anaerobic digester supernatant and means of detecting them were discussed. Two major problems encountered with aerobic supernatant are the tremendous hydraulic loading caused by abruptly returning large amounts of supernatant to the head of the plant and the possibility of high SS levels returned to the head of the plant with the supernatant. The first problem can be determined by noticing SS concentrations at the influent and effluent end of the primary and secondary clarifiers and by noticing solids washing over the weirs during supernatant return. Scheduling the liquid return for low flow times and slowing the rate reduces the hydraulic load on the treatment units. Some form of settling aid can reduce the second problem. With anaerobic digester supernatant excessive BOD can be formed which can be monitored by keeping good BOD records for influent and effluent of each treatment unit and by DO tests to determine the freshness of the incoming load. A black septic sludge on top of primary tanks can indicate a problem. A hydraulic overload may be countered by methods similar to those used with the problem in aerobic digester processes. Turbidity and SS tests can determine high solids loading. Hydrogen sulfide content can be determined by tests or by a rotten egg odor in the plant. Problems with pH can be handled by monitoring the pH of the supernatant. The amount of suspended solids in the supernatant can be controlled by polyelectrolytes. (Collins-FIRL)

SUPERNATANT DECANTING OF AEROBICALLY DIGESTED WASTE ACTIVATED SLUDGE,
Carmel Sanitary District, Calif.
M. Paredes.
Water Pollution Federation Highlights, Vol 13, No 10, p D4-D5, October, 1976. 2 fig.

Descriptors: *Waste water treatment, *Activated sludge, *Treatment facilities, *Aerobic treatment, *Digestion, Sewage treatment, Aeration, Mixing.

The Carmel Sanitary District, in 1973, began operation of a secondary activated sludge treatment process. It included two aeration tanks which were aerated and mixed by two surface aerators which ran continuously. Supernatant decanting basins in each tank helped to settle sludge and return solid materials to the digestion area. Submerged entrance ports allowed mixed sludge to enter the basins and settle on the bottom while clarified or decanted supernatant passed over outlet weirs to return to the waste water flow ahead of the secondary sedimentation tank or to the final clarifier. The sludge was returned to the main digestion area. Because of turbulence in the supernatant decanting basins a clear decanted liquid was impossible. The tanks were alternately shut down creating the problems of sludge rising to the top and going over the weirs and bad odors after start-up. A hole was cut in one side of the decanting basins which extended above and below the water line and a wooden sluice box was attached to the outside of the settling basins over the hole to allow it to slide up and down until clear liquid could be brought into the settling basin and the surface sludge kept out. This caused poor settling in the digestion area and one tank was permanently shut down to receive sludge from the other and act as a settling tank. This cleared the decanted supernatant and improved sludge settling in the main digestion area. A submersible pump was installed 60 cm below water level in the decanting basin of the settling tank to pump clear supernatant to the aeration basins and aid in the clarification of the final clarifier. Drawing off sludge regularly from the bottom of the settling tank, not running an aerator in this settling, and keeping water sprays on top of the tank produces a consistently clear supernatant. INTERMITTENT SAND FILTRATION OF HOUSEHOLD WASTERWATER,
Wisconsin Univ. -Masison. Dept. of Civil and Environmental Engineering.
D. K. Sauer, W. C. Boyle, and R. J. Otis.
Journal of the Environmental Engineering Division, Proceedings of ASCE, Vol. 102, No. EE4, p 789-803, August, 1976. 3 fig, 10 tab, 9 ref, 1 append.

Descriptors: *Waste water treatment, *Activated, Sludge, *Pollutant identification, *Biochemical oxygen demand, *Chemical oxygen demand, Treatment facilities, Filtration, Sands.

Intermittent sand filtration of septic tank and aerobic treatment unit effluents was investigated as an alternative to subsurface disposal for household waste water treatment. Filters at one homesite treated septic tank effluent, while those at another homesite treated activated sludge extended aeration effluent. Twenty-four hour composite samples were obtained from the septic tank, aerobic unit, and intermittent sand filter effluents. Combined aerobic and sand filter treatment provided a highly treated effluent in terms of BOD, COD, and TSS. The effluent quality meets suggested current surface discharge effluent stands. It operated successfully at an average hydraulic loading rate of 3.5 gal/day sq ft for 9 mo. before surface sand maintenance was required. Sand filtration of septic tank effluent at an average hydraulic loading rate of 5 gal/day/sq ft produced complete nitrification and BOD and TSS that meet surface discharge effluent standards. Successful maintenance for sand filters used with a septic tank included removing the top 2 to 5 in. of clogged sand and replacing it with clean sand and raking it without adding clean sand. Total annual costs for treating and disposing of household waste water using intermittent sand filter systems ranged from $400 to $700, depending on the use of septic tanks or aerobic treatment units and the size and method of maintenance of the sand filters. TERTIARY TREATMENT OF SEWAGE EFFLUENTS,
Mander, Raikes and Marshall, Bristol (England).
M. A. Kershaw.
Process Biochemistry, p 21-23, 25, September 1976. 10 ref.

Descriptors: *Waste water treatment, *Sewage treatment, *Biological treatment, *Treatment facilities, *Tertiary treatment, Sewage effluents, Biochemical oxygen demand, Suspended solids.

A review is presented of tertiary treatments, or polishing processes, applied to sewage effluents to make them comply with standards more stringent than 30 ss (suspended solids): 20 BOD. In upward flow filters, the larger solids are trapped in the bottom, coarse medium and the finer solids in the top, fine medium. Their performance depends on the flow rate; with filter effluent loading of 100 cu m/sq m/day 90% solids removal can be achieved. With Micro strainers, results vary with the quality of fabric on the drum, and the key to successful performance is the quality of the influent. Rapid gravity sand filters are successful as treatments for percolating filter and activated sludge effluents. Normal loading is between 200 and 250 cu m/sq m/day. Slow sand filters are found at older, smaller sewage works; they produce higher costs than other methods of effluent polishing. With the upward flow carrier, the effluent is passed up through a bed of pea gravel and the suspended solids are removed from the influent by flocculation and settlement. The action of lagoons or maturation ponds consists of a combination of buffering sedimentation and biological activity. For a retention period of 4 days 40% ss and BOD reduction and 70% E. coli reduction are often achieved. In the operation of grass plots, the first consideration is to ensure that the feed liquor is evenly distributed and does not pond or short circuit. This form of treatment is well suited to small sewage works in rural areas where land is available. (Miller-FIRL)

MINIMIZING THE WASTE DISCHARGES FROM WATER TREATMENT PLANTS,
Connecticut Univ., Storrs. Dept. of Civil Engineering.
T. B. Helfgott, and W. J. Lacy.
American Institute of Chemical Engineers Symposium Series, Vol. 71, No. 151, p 166-169, 1975. 2 fig, 2 tab, 6 ref.

Descriptors: *Sludge treatment, *Dewatering, *Energy equation, *Solid wastes, *Waste water treatment, Electric power, Mathematical models, Waste treatment, Analytical techniques.
Identifiers: Power indices.

A solids power index for making normalized comparisons between various dewatering techniques is proposed. The power index expresses the energy utilization of a dewatering technique in kilowatt-hours/1000 lb dry solids. The parameter is limited in that it does not account for the specific chemical nature of the solids being dewatered nor dewatering characteristics as a parameter for filterability. Graphical comparisons involving the solids power index as a function of % solids are illustrated for dewatering via evaporation, vacuum filtration, double cell gravity concentrations, and screw press multi-roll sludge dewatering. GROUNDWATER QUALITY ADJACENT TO A SEPTIC TANK SYSTEM,
ADI, Ltd., Fredericton (New Brunswick).
T. Viraraghavan, and R. G. Warnock.
American Water Works Association Journal, Vol. 68, No. 11, p 611-614, November, 1976. 8 fig, 2 tab, 9 ref.

Descriptors: *Groundwater, *Water quality, *Septic tanks, Water analysis, Tanks, Nitrogen, Pollutant identification, Soil water, Waste water treatment, Snow, Public health, Lysimeters, Soil analysis.

An investigation was performed to determine the adequacy of a septic tile system as a treatment to reduce constituents of septic tank effluent. Adjacent groundwater was analyzed to determine its chemical and bacteriological quality. The study site was near Ottawa, Canada. Low winter temperatures with snow cover and snow melting in the spring with high groundwater levels were the most significant climatic conditions affecting the study. A collecting tank was installed into which some of the septic tank effluent from the household system was diverted. In addition, an observation trench was constructed to install the lysimeters and collect soil water samples collected through the lysimeters. Groundwater from the observation trench was sampled and analyzed. Test site soil was evaluated as to its percolation rate and coefficient of permeability. Environmental factors considered were temperature, unsaturated depth of soil (depth of groundwater), and snow cover. Results showed that soil removed a high percentage of TSS, BOD, SOC, ammonia nitrogen, iron, coliforms, fecal coliforms and fecal streptococci from septic tank effluent. High ammonia reduction corresponded with increases in nitrate levels in adjoining groundwater, a possible health hazard. Groundwater levels affect soil limits for pollutant absorption. Pollutant concentrations in groundwater as well as nitrate nitrogen were higher near the tile and significantly decreased farther away from the tile end. Winter operation was not especially problematic, as the snow cover and hot water discharge from the system kept nearby ground warm. (Collins-FIRL)

A STUDY OF MIXING CHARACTERISTICS OF SEWAGE STABILIZATION PONDS WITH RADIOACTIVE TRACERS,
Birmingham Univ., (England), Dept. of Civil Engineering.
K. O. Iwugo, and R. Winnicki.
The Public Health Engineer, Vol. 4, No. 5, p 138-142, September, 1976. 5 fig, 4 tab, 15 ref.

Descriptors: Analytical techniques, *Domestic wastes, *Sewage treatment, *Stabilization, *Tracers, Ponds, Mathematical studies, Fluid mechanics, Retention, Radioactivity, Measurement, Evaluation, Performance, *Mixing.

The actual retention times of domestic waste waters in two sewage stabilization ponds were determined using the fundamental fluid mechanics concept of residence time distribution and radioactive tracers. The dispersion index of mixing in each of the ponds was also deduced to quantify the degree of mixing in each of the ponds. Both tritium and chromium-ethylenediaminetetraacetic acid complex were found suitable for the determination of the residence time distribution. Tritium is more economical but has a half-life of 12-15 yr as compared with a half-life of 28 days for the chromium-ethylenediaminetetraacetic acid complex, making

latter tracer more attractive from an environ-
ntal standpoint. (Kreager-FIRL)

oratory scale filters under controlled tempera-
e conditions with and without macrograzers
re used to investigate seasonal variations in the
accumulation in biological filters. The BOD of
d and effluent, the wet weight of the film, and
CO2 output for each filter were determined
ekly. Results indicated that without
crograzers, solids accumulation was controlla-
at higher temperatures by microbiological ac-
ty. Contributing factors for this seemed to be
rnating periods of build-up and sloughing
sed by an increase in the microorganisms
ich are the attachment layer on the substratum
grazing by microfauna, and the differential ef-
t of temperature on the rates of BOD removal
oxidation of the removal BOD. There was a
uction in the oxidation rate as measured by
2 output at temperatures less than 20C, though
ilar temperature reductions did not have a great
ect on the BOD removal rate. The increased ac-
nulated solids in the filter were partially respon-
le for reduced BOD removal efficiency at low
peratures. At 20C, the amount of solids was
trolled at a more uniform and lower level by
zing than by microbiological means. It seems
t some applied organic matter is immediately
dized by microorganisms while some may be
red and oxidized later. (Collins-FIRL)

Identifiers: *Oxygen uptake, *Package plants, Waste loading.

A study was conducted to determine oxygen uptake responses to influent waste loading in an activated sludge system. The study employed a package pilot plant consisting of an aeration basin and a hopper-bottom final settling basin. There were six 24 hr test runs made during the late summer and early fall. Results indicated a direct response of mixed liquor DO to influent substrate load variations when DO levels are greater than the DO concentration critical to microbial oxygen utilization. DO deficit changes were a dependable measure of oxygen transfer rate changes in the mixed liquor and an indirect measure of variations of mixed liquor oxygen demand. Measurement of mixed liquor oxygen uptake rates also proved a good indicator of microbial oxygen uptake response to influent substrate load variations. There was evidence that mixed liquor DO levels below those critical to microbial oxygen utilization contributed to lower substrate removal efficiencies in the system. It was suggested that the magnitude of endogenous respiration and the temporary substrate storage as results of aeration detention time caused a dampening of mixed liquor oxygen uptake response relative to corresponding variations in the influent substrate loading. Maintenance of mixed liquor DO above critical levels is necessary to achieve high substrate removal efficiencies. (Collins-FIRL)

Cape Town Univ. (South Africa). Dept. of Chemical Engineering.
N. P. Harris, and G. S. Hansford.
Water Research, Vol. 10, No. 11, p 935-943, 1976. 12 fig, 1 tab, 43 ref.

Descriptors: *Mathematical models, *Chemical oxygen demand, *Microorganisms, *Slime, Model studies, *Organic loading, Carbon, Oxygen, Kinetics, *Waste water treatment.
Identifiers: *Biofilm reactors, Hydraulic loading.

A mathematical model was proposed to predict the quantity of substrate removable by slime when it is subjected to various hydraulic and organic loadings. It was, also, to determine if performance of the slime was limited by either a lack of organic carbon or oxygen, or both. Supportive data was obtained by measuring substrate removals on a vertical experimental biofilm reactor over a range of hydraulic and organic loadings similar to an industrial type operation. The model is based on basic chemical engineering principles of interfacial mass transfer, diffusion, and biochemical reaction and, using kinetic parameters which fell within variations reported in literature, predicted the reactor's COD removal capacity when subjected to organic and hydraulic loadings. It also showed whether the operation of the film was limited by substrate, oxygen, or both together. It indicated that change from one to the other occurred between organic loadings of 300 to 500 mg/liter COD. There was poor correlation between model predictions and experimental results pertaining to hydraulic loadings approaching minimum wetting rate. The model becomes unreliable in predicting results of conditions of low hydraulic load. (Collins-FIRL)

INNOVATION IS AN OLD IDEA--WITH A BIG FUTURE,
Camp, Dresser and McKee, Boston, Mass.
R. H. Culver, A. A. Kalinske, and R. L. Woodward.
Water and Wastes Engineering, Vol. 13, No. 7, p 43-48, 112, July, 1976. 1 tab.

Descriptors: *Waste water treatment, *Sewage treatment, *Sewage disposal, *Water treatment, Reviews, Computers, Recycling, Design, Potable water, Energy, *Water reuse.

An historical perspective of developments in treating water and sewage was used to project the types of future developments in the field. Advances in this area have traditionally been evolutionary rather than radically advanced by leaps and bounds. Most techniques presently used were developed during the past fifty years and the processes and materials involved refined with the passage of time. Systems are being designed and developed which will have a probable lifetime of fifty to seventy-five years. There is no expectation of radical advances and the water treatment and sewage disposal systems of the next one hundred years will be quite recognizable. Considerations such as cost effective systems and energy efficiency, as well as resource recovery and recycling of

clarified water for uses other than drinking water. Computerization will also become a more important part of systems design in the future. (Collins-FIRL)

REMOVAL OF BOD AND NITROGENOUS POLLUTANTS FROM WASTEWATERS,
Air Products and Chemicals, Allentown, Pa. (Assignee).
J. P. Casey, and M. L. Spector.
United States Patent 3,994,802. Issued November 30, 1976. Official Gazette of the United States Patent Office, Vol. 952, No. 5, p 2160, November, 1976. 1 fig.

Descriptors: *Patents, *Waste water treatment, *Aerobic conditions, *Anaerobic conditions, *Nitrogen, *Biochemical oxygen demand, *Mixing, *Activated sludge, Nitrification, Denitrification, Dissolved oxygen.

A process for purifying waste water with activated sludge has been patented. Waste water is subjected to continuous flow through several successive zones of an activated sludge system, where BOD is reduced and nitrogenous pollutants are removed. The influent waste water is mixed with activated sludge, nitrified and denitrified, and mixed with free oxygen-containing gas under aerobic conditions. This provides a mixed liquor which is passed, without separation, to further treatment under anaerobic conditions in the presence of nitrates or nitrites plus microorganisms. The liquor is then again treated with an oxygen-containing gas and is introduced into a final settling zone to separate the settled solids from the supernatant liquid. Part of the settled solids are returned as activated sludge; a portion of the microorganisms which have been oxidized are returned; and the mixed liquor is maintained with a dissolved oxygen level of one ppm and a F/M ratio of 1.5. SEWAGE SLUDGE TREATMENT SYSTEM,
California Inst. of Tech., Pasadena, Calif. (Assignee).
J. J. Kalvinskas, S. Pasadena, and W. A. Mueller.
United States Patent 3,994,804. Issued November 30, 1976. Official Gazette of the United States Patent Office, Vol. 952, No. 5, p 2160-2161, November, 1976. 1 fig.

Descriptors: *Incineration, *Sewage treatment, *Liquid wastes, *Activated carbon, *Recycling, Mixing, Sludge treatment, Sludge disposal, Settling basins, Sedimentation, Effluents, *Sewage sludge, *Patents.
Identifiers: *Pyrolysis.

A patented method for treating raw liquid sewage is described. The process, used when the waste includes water with dissolved organic and inorganic matter as well as suspended matter, involves mixing the raw liquid waste with activated carbon and ash, then introducing the mixture into a primary settling tank for settling the suspended matter as primary sludge. The effluent from this first tank is mixed, then fed to a secondary settling tank to permit the settlement of secondary sludge. Both the primary and secondary sludges are dewatered and sent to pyrolysis equipment. There, they are formed into activated carbon and ash, mixed with raw liquid waste and effluent. In this particular invention, the primary and secondary sludges are pyrolyzed separately to form separate quantities of activated carbon and ash. The products of pyrolysis of the primary sludge are mixed with the raw waste while the products of the pyrolysis of the secondary sludge are mixed with the effluent from the first settling tank. FLUIDIZED WASTE INCINERATOR AND METHOD,
Shell Oil Co., Houston, Tex. (Assignee).
W. R. Pledger, and J. E. Gwyn.
United States Patent 3,994,244. Issued November 30, 1976. Official Gazette of the United States Patent Office, Vol. 952, No. 5, p 1975, November, 1976. 1 fig.

Descriptors: *Incineration, *Sewage treatment, *Sewage sludge, *Sludge disposal, *Patents, *Equipment, Waste water treatment, Joints(Connections).
Identifiers: Combustion, Conduits, Fluidized beds.

A patent has been granted for a fluidized bed incinerator for sewage sludge and similar waste liquids containing a high proportion of easily fusible salts. The equipment includes: a refractory lined vessel; means for holding dense fluidized-solids in a bed in the lower part of the vessel, with a bed supporting grate and means to force air upward through the bed; equipment to introduce a stream of feed into the fluidized bed; and effluent take-off means to communicate with the upper portion of the vessel and withdraw an effluent stream of combustion vapors and entrained solids. These take-off means have the properties of comprising a refractory-lined metal conduit which connects one end of the vessel with the other; a second conduit, communicating with the first, at about right angles; and quench water injection means adapted to spray quench water directly into the opening of the second conduit. FERMENTATION OF WASTE MATERIALS TO
PRODUCE INDUSTRIAL INTERMEDIATES,
Oak Ridge National Lab., Tenn.
A. L. Compere, and W. L. Griffith.
Available from the National Technical Informa
tion Service, Springfield, VA 22161 as CONF
750823-3, Price codes: A02 in paper copy, A01 i
microfiche. CONF 750823-3, (1975). 16 p, 1 fig,
tab, 8 ref.

Descriptors: *Recycling, *Waste treatment
*Fermentation, Acids, Organic matter, Alcohols
Technology.
Identifiers: *Lactic acid, Volatile acids, Whey.

The utilization of organic wastes by fermentatio
to produce commercially valuable acetic acid
acetone, n-butyl alcohol, ethyl alcohol, formi
acid, lactic acid salts and proprionic acid i
proposed. Production of lactic acid for use in dair
products or for production of acrylic acid an
other industrial compounds from waste sour whe
is illustrated by a bench-scale system, seeded by
kefir-delivered culture, and using a fixed-filt
bioreactor (ANFLOW unit), and an ion exchang
column. The whey lactic acid concentration wa
increased to 2.1% from 1.4% after a single passag
through the ANFLOW unit and the six-foo
column, then stripped of its lactic acid by
macroporous weak anion exchange resin. If acids
rather than salts, are desired as resin products
they can be stripped with a strong acid, such a
sulfuric acid, and regenerated with a base in
separate step. The lactic acid recovery equalle
62%. Recovery of a more concentrated lactic aci
solution is possible. Many industrial wastes coul
serve as fermentation feeds and althoug
byproduct recovery may be marginal it can b
profitable when it is coupled with the consequen
decreased sewer charges due to decreased organi
contents and SS of wastewaters. The system i
comparable to a conventional industrial sewag
treatment or water-softening unit. (Auen-Wiscon
sin)

THE COST OF PRODUCING EFFLUENTS TO
VARYING STANDARDS BY BIOLOGICAL
TREATMENT TECHNIQUES,
J. M. Sidwick, and J. R. Preston.
Effluent and Water Treatment Journal, Vol. 16
No. 5, p 238-241, 244-247, May, 1976. 8 fig, 5 ref.

Descriptors: *Capital costs, *Waste water treat
ment, *Biological treatment, *Activated sludge
*Biochemical oxygen demand, *Treatment facili
ties, Effluents, Standards, Mathematical studies
Cost analysis.

The capital costs of achieving various standards o
effluent by biological methods are discussed. Vari
ous mathematical fits were examined with the
assistance of a computer. Recorded and reported
costs on civil engineering schemes are rarely on
the same basis: unit costs may or may not include
ancillaries. Principal biological treatment method
are subdivided into biological filtration and ac
tivated sludge treatment. Thirty mg/liter
suspended solids and 20 mg/liter biochemical ox
ygen demand (BOD) in 5 days was taken as the
norm for full treatment. The cost per head
decreases as population increases for inlet works
Rectangular, pyramidal, and circular primary sedi
mentation tanks did not differ significantly with
regard to costs. Since the principal cost of a
biological filter is in the medium, the curve for
cost per cu m follows a predictable slope showing
reducing unit cost with increasing volume. Insuffi

nt data were available upon which to base aningful cost curves for high-rate biological fil- s using conventional medium, but conventional dia installations are less expensive in terms of ital cost than their synthetic medium counter- rts. High rate activated sludge treatment is less ensive than standard rate activated sludge atment for all population sizes. Cost decreases volume and population increase. Site costs vary m 25% of the aggregated unit costs for the aller works to 10% for the larger works. Aera- n package plants are cheaper than package nts using biological-disc methods of treatment. general, cost per population equivalent reases as unit size increases. (Snyder-FIRL)

CENT DEVELOPMENTS IN THE USE OF LYELECTROLYTES,
B. Moll.
ter and Waste Treatment, Vol. 19, No. 9, p 39, otember, 1976. 2 tab.

scriptors: *Waste water treatment, *Sewage atment, *Sewerage, *Polyelectrolytes, eparation techniques, Solid wastes, Liquids, watering.

nthetic polyelectrolytes have received much at- tion in Britain for use in the solid-liquid separa- n process of sewage treatment. They are erally reliable in achieving a high degree of ids recovery and have been used in mechanical watering and vacuum filtration. 'In-line' dosing sludge has proved suitable for most sludge nps and eliminates the need for chemical paration and dilution tanks, thus offering con- erable cost savings. Polyelectrolytes have suc- sfully replaced traditional conditioners such as lime-coppera s combination and aluminum orohydrate. Their use has proven advantages ich include: elimination of scaling problems, in- ased press capacity, reduced chemical handling blems, elimination of inorganic conditioner-in- ced corrosion, reduction of chemical storage ce needs, and a non-contribution to ash loading en incineration is considered. It is concluded t further investigation will reveal other produc- e uses for synthetic polyelectrolytes. (Collins-RL)

DIUM BICARBONATE NEUTRALIZES,
Barber.
e American City and County, Vol. 91, No. 11, p 55, November, 1976.

scriptors: *Waste water treatment, *Sewage atment, *Biological treatment, *Sewerage, eatment facilities, Sodium compounds, Bicar- nates, Neutralization.
ntifiers: Sodium bicarbonate.

rge amounts of waste paper fibers collecting in primary settling basin of the West Nyack, N. sewage treatment plant caused a serious ester souring problem. The system's pH had en from 7 to 4.8. Raw sewage was pumped into primary digester, but the anaerobic microor- isms were adversely affected and recovery was ubtful. About 700 lb/day of sodium bicarbonate s added and the pH began to rise, ranging from to 7.1. Alkalinity rose from less than 2000 /liter to 4000 mg/liter. Waste digestion im- ved greatly. When reasonable pH and alkalinity els were reached, about 150 lb/day of sodium arbonate were applied as a preventative. The dual addition of sodium bicarbonate was also d to clear emulsion blockage of the settling ks. Sodium bicarbonate functions as a buffer in maintenance of desired acidity-alkalinity ratios microbial activity. Sodium bicarbonate also ys a role in pH control and is an ideal medium increasing methane production in anaerobic tems and precipitating toxic metals. (Collins-RL)

EFFECT OF HIGH DISSOLVED OXYGEN CONCENTRATION IN ACTIVATED SLUDGE SYSTEMS,
T. D. Chapman, L. C. Matsch, and E. H. Zander.
Journal Water Pollution Control Federation, Vol. 48, No. 11, p 2486-2510, November, 1976. 7 fig, 7 tab, 69 ref.

Descriptors: *Waste water treatment, *Activated sludge, *Biochemical oxygen demand, *Dissolved oxygen, *Oxygen, Basins, Biological treatment, Biomass.

An evaluation of the UNOX oxygen activated sludge system was given to prove its advantages. The system is designed to use high purity oxygen for the dissolved oxygen (DO) requirements, to use a covered basin for contact between biomass, oxygen, and waste water, to operate in the same average range of power densities as air systems but at lower ones near the end of the train to develop a well flocculated biomass, to handle a broad range of F:M loadings, and to operate at a DO level range of 2 to 6 mg/liter. Aspects discussed are the effect of DO in activated sludge, organic loading and effluent quality, settleability of OE solids and MLSS levels, sludge production nitrification, and process stability. Oxygen systems have no advantage relative to settleability, operation at higher organic loadings, or waste sludge production. But at DO levels of 4 to 6 mg/liter (oxygen system) and 1 to 2 mg/liter (air system) the following observations were made. Higher DO level oxygen systems can operate at biomass loadings (F:M) of more than twice that of air systems with the same BOD5 and SS quality effluent. Settleability of oxygen system sludge is greater, allowing higher solids loading on the clarifier with higher recycle solids and MLSS concentrations. There is also improved dewatering of oxygen activated sludge. Less sludge is produced with the oxygen system at equivalent apparent F:M ratios. It was concluded that these characteristics were due to the increased viability of the oxygen system mixed liquor resulting from increased oxygen penetration into the floc matrix. (Collins-FIRL)

SLUDGE DRYING BEDS ARE PRACTICAL: PART 2,
J. A. Beardsley.
Water and Sewage Works, Vol. 123, No. 8, p 42-44, August, 1976. 4 fig.

Descriptors: *Waste water treatment, *Sewage treatment, *Treatment facilities, *Sewage sludge, *Drying, Chemicals, Efficiencies, Sludge treatment.
Identifiers: *Drying beds.

Chemical conditioning is important to the efficient operation of sludge drying beds. Using polymer flocculants to treat sludge prior to bed drying offers several benefits, including increased production from existing beds, heavier loadings without blinding, reduced odor because of rapid drainage, application of variable sludges and supernate, less sludge hauling because of drier cake, and easier unloading because sludge does not form small fractured crumble. Cationic polymer flocculants are most appropriate for sewage sludges. The polymer flocculant will release large quantities of free water while forming a large well-defined floc. The flocculant ties up fine supernate solids and removes the greatest volume of liquid from the digester for a given amount of solids, prevents upsets in the primary due to recycling anaerobic colloidal solids, and provides for longer stabilization time of the remaining solids. Solution flocculants allow simpler feed systems than dry polymers, but both require dispersing and metering equipment. Chemical application has made it possible for a plant using a trickling filter and mixed sludge to switch from anaerobic to aerobic digestion without adding more sand beds. In one experiment, much more water was drained from a treated sludge bed than from a similar untreated bed. Chemical addition dramatically improved dewatering at a plant where an alum-anionic flocculant program resulted in additional solids to dewater. (See also W76-00039)(Snyser)-FIRL)
W77-03572

INHIBITING NITRIFICATION IN WASTEWATER TREATMENT PLANTS,
E. L. Stover, A. Esfandi, H. Little, and D. F. Kincannon.
Water and Sewage Works, Vol. 123, No. 8, p 56-59, August, 1976. 5 fig, 11 ref.

Descriptors: *Waste water treatment, *Biological treatment, *Activated sludge, *Biochemical oxygen demand, *Chemical oxygen demand, Treatment facilities, Pollutant identification, Nitrification.

Apparent inhibition of nitrification was studied in continuous flow and batch studies using an experimental bench-scale activated sludge unit. Many compounds inhibit nitrification by interference with the general metabolism of the cell or with the primary oxidative reactions. When the influent chemical oxygen demand (COD) to an activated sludge plant increased and a sharp increase in biological solids occurred, the nitrification efficiency of the system decreased. Glucose concentrations under 750 mg/liter COD did not change nitrification rates in batch reactors containing nitrifying microorganisms, but concentrations of 777 mg/liter and 1139 mg/liter inhibited nitrification rates in the same type systems. In completely mixed one-stage activated sludge treatment plants, substrate concentrations of this magnitude would seldom occur, and the organic substrate by itself would not inhibit the biological nitrification process in such systems. A reasonable explanation would be the production by the heterotrophic microorganisms at fast growth rates of intermediary metabolic byproducts which inhibit biological nitrification. This is supported by data from other nitrification investigations. As the influent COD or biochemical oxygen demand (BOD) concentrations to a system increase, the rate of carbonaceous microorganism growth increases and depresses the nitrification rate of the system. EXPERIMENTS ON WASTEWATER SEDIMENTATION,
University of Manchester Inst. of Science and Technology (England).
J. B. White, and M. R. Allos.
Journal Water Pollution Control Federation, Vol. 48, No. 7, p 1741-1752, July, 1976. 8 fig, 2 tab, 2 ref, append.

Descriptors: *Flow rates, *Sedimentation rates, *Tanks, *Waste water treatment, Suspended solids, Settling, Effluents, Clarification.
Identifiers: *Circular center-feed sedimentation tanks.

Tests were conducted to examine the performance of circular center-feed sedimentation tanks in the primary stage of waste water treatment. Major variables involved were the rate of flow through the tank, the concentration of suspended solids in the feed, and the settling characteristics of the suspension. Various tests were made on a full-sized tank with no control of these variables and in a small tank with means of controlling them. Settling column tests were also run on samples of the waste water used. Settling column tests on raw waste water had results which differed from those of discrete suspensions. Suspended solids concentrations decreased with time, and the rate of decrease lessened with time. Concentrations increased little with depth. Initial suspended solids concentrations greatly affected the degree of clarification in a given time. There was evidence of highly variable settling characteristics in waste

water. The relationship of effluent and influent concentrations and detention time in the tank tests and column tests were such that the column tests results gave an approximation of performance in the tanks. It was shown that, after two hours, only little further clarification can be expected. Other tests with reconstituted waste water indicated that the limit of concentration may decrease with decreasing surface loading. (Collins-FIRL)

AERATION AND OXYGEN TRANSFER IN BIOLOGICAL REACTORS,
Vanderbilt Univ., Nashville, Tenn.
W. W. Eckenfelder, Jr.
La Tribune du Cebedeau, No. 389, p 160-167, April, 1976. 5 fig, 1 tab, 14 ref.

Descriptors: *Waste water treatment, *Biological treatment, *Treatment facilities, *Aerobic treatment, *Aeration, Aerobic conditions, Oxygen, Transfer, Equipment.
Identifiers: *Oxygen transfer, *Biological reactors.

The supply of oxygen to an aerobic biological treatment system is a critical aspect of proper design and operation. Oxygen, which is sparingly soluble in water, is transferred from the gas phase to the liquid phase by diffusion and convection to a concentration in accordance with Henry's Law. Under turbulent flow conditions assuming that the resistance of the liquid film controls oxygen transfer rate, transfer of oxygen from the gas to the liquid phase is a function of the overall transfer coefficient and the oxygen deficit. When oxygen is supplied to fluidized systems treating waste water via aerobic biological oxidation, a correction factor must be defined which relates the oxygen transfer to the nature of the waste. Aeration equipment is categorized into three systems: diffused aeration, turbine aeration, and mechanical aeration. All three are discussed. Diffused aeration systems include bubbler aeration and static aeration. Air is discharged from a pipe or sparge ring beneath the rotating blades of an impeller in turbine aeration. (Snyder-FIRL)
W77-03575

FLOTATION FOR WATER AND WASTE-WATER TREATMENT,
J. Pullin.
Surveyor, Vol. 4383, No. 147, p 39-40, June 11, 1976. 2 fig.

Descriptors: *Waste water treatment, *Sewage treatment, *Sewerage, *Treatment facilities, *Flotation, *Water treatment, Waste water(Pollution), Bubbles.
Identifiers: *Microflotation.

Microflotation is based on the idea that, for effective flotation, the bubbles which take the solids or oil particles to the surface should be numerous but small in size. After chemical treatment and aeration, the effluent flows down a 10 m deep divided shaft, which keeps the downward flowing effluent away from the effluent which rises into the flotation tank. Air is injected at the bottom of the shaft. Floc agglomeration begins when the effluent, free from undissolved air, begins to rise up the shaft toward the flotation tank, and gas bubbles form as the gas content of the effluent exceeds the saturation level. A dissolved air flotation plant has been in continuous operation at a sewage treatment works for 3 years with few operational problems. The plant produced a consistently good sludge float averaging 4% dry solids, good effluent and solids removal efficiencies of over 99.7%. After a series of trials using different polyelectrolytes, Zetag 94 was used as a flotation aid. It might be possible to use flotation units to elutriate and thicken digested sludge prior to mechanical dewatering, instead of using elutriation tanks. Operational experience in potable water treatment is also discussed. Practical examples are included. (Snyder-FIRL)
W77-03576

WASTEWATER'S FUTURE IS CLOUDY,
W. J. Storck.
Water and Wastes Engineering, Vol. 13, No. 7, p 20-22, July, 1976.

Descriptors: *Waste water treatment, *Sludge disposal, *Water reuse, Recycling, Potable water, Landfill, Incineration, Cost analysis, Treatment facilities.

A great deal of concern has been expressed for the future development of waste water treatment systems. The major problem is that research will probably be lessened in order to rush practical development. The primary concern is for finding means of reusing treated waste water instead of merely disposing of it. One projection involves the direct reuse of waste water as potable water. This depends upon public acceptance of the idea as well as the introduction of systems which can provide water of the required quality. Sludge also receives attention as a product of waste water treatment. It is suggested that its use as landfill or fertilizer may be extremely viable alternatives. Pyrolysis and the use of sludge--derived methane gas are also considered. Any system or method must be cost effective. (Collins-FIRL)

OXYGEN TRANSFER IN A 23-METER BUBBLE COLUMN,
Idaho Univ., Moscow.
M. L. Jackson, D. R. James, and B. P. Leber, Jr.
American Institute of Chemical Engineers Symposium Series, Vol. 71, No. 151, p 159-165, 1975. 4 fig, 2 tab, 5 ref.

Descriptors: *Aeration, *Waste water treatment, *Oxygen, Transfer, *Efficiencies, Waste treatment, Performance, Evaluation, Pulp and paper industry, Industrial wastes, Bubbles.

Oxygen transfer efficiencies in an aeration column (7.6 cm in diameter) were observed for liquid depths up to 21 m. Although higher air rates and liquid depths increased the oxygen transfer rate and overall efficiency, the transfer area was reduced with increasing liquid level because of the higher pressures on the entering bubbles. A diffuser provided 96% oxygen transfer at 8 m, and a pipe inlet provided 63% transfer at a liquid depth of 21 m. The performance of the narrow column may also be used to judge applications to large diameter aeration tanks with multiple inlets. The design of a plant for the treatment of 15,000 cu m/day of waste from a sulfite paper mill based on the results observed for the narrow column was analyzed in terms of treating the same waste in a lagoon; the results were favorable for tall tank aeration. (Kreager-FIRL)

AN ECONOMIC EVALUATION OF DEEP TANK AERATION FOR WASTEWATER TREATMENT,
Idaho Univ., Moscow.
L. L. Edwards, B. P. Leber, Jr.., and M. L. Jackson.
American Institute of Chemical Engineers Symposium Series, Vol. 71, No. 151, p 154-157, 1975. 4 tab, 13 ref.

Descriptors: *Aeration, *Cost analysis, *Waste water treatment, *Stabilization, *Oxygenation, Transfer, Oxygen, Economics, Model studies, Pulp and paper industry, Industrial wastes, Liquid wastes, Waste treatment.
Identifiers: Deep tank aeration.

An economic comparison between a deep-tan aeration system and a conventional aerated st bilization basin for the treatment of 4.5 million ga lons/day of waste water from a sulfite pulp mill presented. The deep-tank aeration system is reality a vertical flow reactor which takes a vantage of the large partial pressure driving for for oxygen transfer at the bottom of the tank. Th analysis consists of modeling oxygen transfer deep tanks and designing a minimum-cost dee tank treatment process. The deep tank system designed with standby capacity for pumps, com pressors, deep tanks, and a settling tank to insu continuous operation. The economic analysis i dicates that the deep-tank system requires capital investment of $647,000 which is 10% low than that for the aerated basin. The deep-tan system also results in a 58% reduction in total ele trical energy usage. (Kreager-FIRL)

CONDUCTING SEWER SYSTEM EVALU TIONS FOR SMALL SYSTEMS,
P. E. Darnell.
Water and Sewage Works, Vol. 123, No. 11, p 6 71, November, 1976.

Descriptors: *Sewerage, *Sewers, *Infiltratio *Inflow, *Evaluation, Data processing, Analyti techniques, Monitoring, Inspection, Cleanin Repairing, Surveys, Cost analysis, Flow
Identifiers: *Infiltration/inflow.

Various aspects of an Infiltration/Inflow Analy were described. This analysis applied to sew systems with a total installed length of lines 200,000 ft or less. Its function was to determi system susceptibility to excessive infilt tion/inflow. Detailed descriptions were given f the three phases of analysis (evaluation surve physical survey, and data analysis). Accurate flo data was a prime prerequisite in making all det minations. Smoke testing for leaks, observati during a rainfall or a rainfall simulation, and mo toring of groundwater levels in the system we important considerations. Preliminary data ana sis involved an estimation of the quantity of wa needed in a line section to justify costs of cleani inspecting, and rehabilitating the line. Conside tion was also given to the option of replaceme work. This was followed by a preparatory cleani and internal inspection of the lines. Advantag and disadvantages of cleaning systems were co pared. These activities were followed by evaluation survey and the preparation of cost es mates for needed work. (Collins-FIRL)

neration of sewage plant sludge is disussed and
pared to other methods of sludge control. EPA
ies have proved sludge incineration adequate
neeting present air quality standards. This is
of both multiple-hearth and fluidized-bed in-
rators. A 1972 study noted that most sludge in-
rators of the time did not use high-efficiency
iculate control devices and traces and small
ntities of specific metals, PCBs, and pesticides
d be found in stack emissions. Particulate con-
is a part of all sewage sludge incinerators now.
st metals either oxidize and are collected in the
om ash or are collected during the particulate
bbing phase. Sludge incinerators have been
ven to destroy 99% of pesticides and 94% of
ds when they are coincinerated with sludge. In
ns of overall economics, sludge incinerators
e proven to be half as costly as land application
Boston, Massachusetts. The same study rated
neration slightly better in terms of environ-
ntal impacts. It is also the best alternative to
an disposal in the near future. The ash is free of
icides, viruses, and pathogens, and easily
sported to landfill sites. (Collins-FIRL)

Descriptors: *Sludge disposal, *Sludge treatment, *Waste water treatment, *Costs, Landfills, Lagoons, Recycling, Fertilizer, Incineration.

The problem of sludge disposal has become one of major importance. Estimates place the cost of sludge treatment and disposal at 25 to 50% of total waste water management costs in the United States. Until now, purification was the main objective of treatment. The EPA is setting standards for treatment and the management of resultant residues. Landfill disposal is losing ground to other disposal options. Lagooning, ocean disposal, use as fertilizer, use of sludge-derived methane, and incineration have become attractive alternate methods. Future emphasis will be on improved operating techniques, recycling and minimizing waste streams, and on holding down water costs. Social, economic, and environmental factors must be included in all future planning. (Collins-FIRL)

'GIVE FLOTATION A TRY' WAS CHALLENGED.
New Civil Engineer, p 16, June 10, 1976.

Descriptors: *Flotation, *Filtration, *Water treatment, Water quality, Separation techniques, Flocculation, Surface waters, Sludge disposal, Sludge treatment, Treatment facilities, Sedimentation, Costs.

The water authorities of Britain were urged to consider flotation as an alternative to filtration in water treatment. Claims based on Scandinavian experiences indicated that treated water quality is such that final filtration is sometimes unnecessary. It was suggested that thorough flocculation and separation tests would speed use of the flotation process in most surface water treatment plants. Advocates of the system have claimed several advantages for the process: smaller tank sizes with surface loading up to 10 times that of sedimentation tank loading, reduced chemical usage due to lighter flocs used, higher treated water quality from better solids recovery, and drier sludge. However, there would be higher energy costs and increased maintenance requirements due to the greater mechanical equipment needed. With the benefits of improved sludge handling and cheaper disposal, flotation has some cost advantage over sedimentation and, if filtration could also be replaced, the system could provide substantial financial savings. Environmental Science and Technology, Vol 10, No 12, p 1151-1156, November, 1976. 12 fig, 3 tab, 16 ref.

Descriptors: *Water treatment, *Chlorination, *Treatment facilities, *Temperature, Hydrogen ion concentration, Laboratory tests, Sampling, Water analysis, Analytical techniques, Organic compounds.
Identifiers: Polynuclear aromatic hydrocarbons(PAH).

Eight polynuclear aromatic hydrocarbons (PAH) were subjected to chlorination and the results were evaluated against PAH removal at a water treatment plant. In lab tests, PAH's and a chlorinating agent were added to three aliquots of distilled water with one aliquot of distilled water as a blank. Various values of temperature, contact time, and reagent concentrations were tested. For comparison, samples from water treatment works were collected in glass vessels and extracted and analyzed by gas-liquid chromatography. The study revealed a 64-88% PAH removal by chlorination as compared to water treatment plant removal of about 60%. This difference is probably due to impurities in the water. Temperature, pH, and the concentrations of PAH and chlorinating agent have varying effects on PAH removal. Efficient filtration in treatment plants removes a substantial amount of PAH and chlorination furthers the process. (Collins-FIRL)

Descriptors: *Water quality, *Land use, Agriculture, *Erosion, *Indiana, Sediments, Sedimentation, Suspended solids, Watersheds(Basins), Rivers, Nutrients, Pollutants, Fertilizers, Social aspects, Economics, Economic impact, Soil conservation, Farm management, Water pollution, Water pollution sources, Water pollution control.
Identifiers: *Black Creek(Ind), *Maumee River Basin(Ind).

The Black Creek Sediment Study is an attempt to discover the role that agricultural operations play in the pollution of the Maumee River and to show how that role can be diminished through the application of significant land treatment practices. The project represents a multi-agency, multi-discipline approach to the total problem of non-point source pollution. The problem of non-point source pollution is becoming more and more important in the nation's overall effort to clean up the degraded streams and lakes. As major point sources of pollution such as industries and municipalities are brought under control and begin to contribute less and less of the total pollutant load, the necessity of controlling pollution which originates from small, hard-to-identify sources becomes more and more critical. Our understanding of the mechanisms by which pollutants from diverse small sources is carried into the nation's waterways to become - in the aggregate - a large problem is not so advanced as is our understanding of the monitoring and control of point-source pollution. The Black Creek project is intended to provide significant data on which future decisions about efforts to control this type of pollution - if it indeed can be controlled at a cost that all citizens are willing to bear - can be based. Two years of operation of this project were described and significant results were reported. (Sims-ISWS)

PRACTICAL ALTERNATIVES TO 2,4,5-T FOR CHEMICAL CONTROL OF BRUSH ALONG DRAINAGE DITCHES AND GENERAL WATERSHED USE,
Purdue Univ., Lafayette, Ind. Water Resources Research Center.
D. J. Morre.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-262 217 Price codes: A02 in paper copy, A01 in microfiche Purdue Water Resources Research Center Technical Report No. 83, 1976, 11 p, 2 fig, 3 tab. OWRT A-049-IND(1).

Descriptors: *Herbicides, *Brush control Drainage, *2-4-D, *2-4-5-T, *Chemcontrol Watershed management, Organic compounds.
Identifiers: Dicamba mixtures, Krenite mixtures Environmental safety, *Drainage ditches.

The objective was to provide a practical alterna tive to 2,4,5-T as a brush control agent for gener watershed use. Two such agents are described an specific recommendations are made for ditchban and other watershed uses. The agents are (1) a 3 way Phenoxy-Dicamba mixture consisting o equal parts of an amine salt formulation of 2,4-D (2,4-dichlorophenoxyacetic acid), 2,4,5 TP (Silve or 2,4,5-trichlorophenoxypropionic acid) an dicamba (Banvel or 3,6-dichloro-o-anisec acid and (2) Krenite (ammonium ethyl ca bamoylphosphonate) plus a nonionic surfactan (Surfactant WK, Tween 20, or Triton X-100 o equivalent product). The 3-WAY Mix gives th broadest control of species; Krenite has a slig edge in overall safety, but is restricted to use fo ground application.

ALLATOONA LAKE, DESTRATIFICATIO EQUIPMENT TEST REPORT.
Army Engineer District, Savannah, Ga.
Available from the National Technical Informa tion Service, Springfield, VA 22161 as ADA-02 883, Price codes: A05 in paper copy, A01 i microfiche. June 1973. 73 p, 43 fig, 9 tab, 11 ref.

riptors: *Water quality, *Lakes, *On-site in-gations, *Georgia, *Destratification, On-site collections, Surveys, Evaluation, Instrumen-, Data collections, Reservoirs, Stratification, lved oxygen, Water temperature, Nitrates, es, Nitrogen, Manganese, Carbon dioxide, s, Air, Biota, Plankton, Phosphates, Al-ty, Hydrogen ion concentration, Iron, Ther-tratification, Thermocline.
ifiers: *Allatoona Lake(Geo).

perimental field investigation was conducted e Allatoona Lake Project during 1968, 1969, 970. The purposes of the investigation were: determine the effects of the operation of atification equipment, specifically a diffused mp, on the water quality of Allatoona Lake eleases therefrom, and (2) to develop criteria esign and operation of similar equipment at impoundment projects. The diffused air was located about 2,000 feet upstream from Allatoona Dam. The destratification results evaluated using available data of the project 966 and 1970, a mathematical model for pre-g water temperature, and a multiple regres-model for predicting dissolved oxygen. Dis-d oxygen isopleths of the Allatoona Lake ed that the diffused air pump operation bly affected dissolved oxygen concentrations zone extending about four miles upstream the dam. The diffused air pump operation ed the stability, or intensity, of thermal fication in the lake. Operation of the air pump ingly had little short term effect on the ic and planktonic communities within the Qualitative studies of the benthic biota stream from the dam indicated a more se community during 1968 and 1969, possibly the increased dissolved oxygen in the ses from the lake. Bacteriological data ob-d in the lake near the diffuser units did not any significant effect of artificial destratifi-n on coliform density or vertical distribution ese bacteria. ALLATOONA LAKE, DESTRATIFICATION EQUIPMENT TEST, APPENDIX D, EFFECTS OF ARTIFICIAL DESTRATIFICATION ON TEMPERATURE AND DISSOLVED OXYGEN IN ALLATOONA RESERVOIR.
Associated Water and Air Resources Engineers, Inc., Nashville, Tenn.
Available from the National Technical Information Service, Springfield, VA 22161 as ADA-022 927, Price codes: A07 in paper copy, A01 in microfiche. June 1971. 139 p, 16 fig, 8 tab, 31 ref, 1 append. DACW 21-70-C-0008.

Descriptors: *Water quality, *Reservoirs, *Model studies, *Water temperature, Computer programs, Mathematical models, Analytical techniques, Equations, Dissolved oxygen, Forecasting, Lakes.
Identifiers: *Allatoona Lake(Geo).

Field studies were conducted at the Allatoona Lake Project during 1968, 1969, and 1970 to investigate the feasibility of and effects resulting from use of diffused air pump destratification equipment on the lake water quality. Dissolved oxygen and water temperatures within the reservoir and in its releases are of primary importance as measures of the water quality. Appendix D describe a water temperature predictive model that had been developed. The goal was to use 1970 Allatoona data to verify the model's applicability to Allatoona, and then to use the model to predict 1969 temperatures in the reservoir. The predicted results indicated that calculated values do follow the trend of observed values, but the results were too crude to be used for anything except generalized predictions. The assumptions made in the model were too coarse, and a more satisfactory model for oxygen content must be sought. An appendix contained the details for the deep reservoir simulation model computer program. (See also W77-03306) (Humphreys-ISWS)

NATIONAL SAFE DRINKING WATER STRATEGY, ONE STEP AT A TIME.
Environmental Protection Agency, Washington, D.C. Office of Planning and Evaluation.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-250 436, Price codes: A05 in paper copy, A01 in microfiche. May, 1975. 77 p, 2 fig, 5 tab.

Descriptors: *Legislation, *Potable water, *Public health, *Water quality standards, *Water policy, Groundwater, Underground, Injection, Programs, Federal project policy, Federal government, *Water pollution control.
Identifiers: Safe Drinking Water Act.

A safe drinking water strategy which has been developed to clarify the Environmental Protection Agency's policy with respect to implementing the Safe Drinking Water Act is described. The strategy proposes the following principles for implementing the Act: a commitment to give highest priority to public health matters; the involvement of states, local governments, and consumers in all

aspects of the program; the consideration of worst problems first; a consideration of the costs involved in all phases of the program; maximum utilization of existing state and local water supply control programs; decentralization of decision-making to Environmental Protection Agency regional offices; a consideration of the environmental side effects of actions taken under the Act; and the minimization of 'red-tape' in all actions. The Environmental Protection Agency also plans to implement an underground injection control program prescribed by the Act with the same step-by-step approach. (Kreager-FIRL)

DELAWARE 1975 STATE WATER QUALITY INVENTORY,
Department of Natural Resources and Environmental Control, Dover, Dela. Div. of Environmental Control.
N. C. Vasuki, and J. L. Pase.
April 1975. 219 p. 59 fig., 3 tab., 29 charts, 2 ref.

Descriptors: *Water quality standards *Delaware, Federal Water Pollution Control Act, Water pollution, Eutrophication, Sedimentation, Coliforms, Water quality, Waste water treatment, Costs, Pollution abatement, Surveys.
Identifiers: *State Water Quality Inventory(Delaware), *Nonpoint source pollution.

Delaware water quality was assessed in accordance with the requirements of the Federal Water Pollution Control Act Amendments of 1972. Water quality in Delaware was generally considered good. A major exception was a portion of the Delaware River, which will require upgrading of major Pennsylvania and New Jersey treatment facilities. Of the 20 segments in the stae, 6 appeared to meet all or most water quality criteria, 7 have had occasional problems, and 7 have had continuing problems in more than one water quality parameter. The tidal portion of ten segments were significantly affected by non-point source pollution from natural estuarine system processes. Excess bacteria counts were the major surface water problem, resulting primarily from urban and rural runoff, and waterfowl and wildlife. Lake degradation due to sedimentation and eutrophication was also significant. Heavy metals and toxic materials were not major problems. Point source discharge was important in certain segments, particularly those with limited assimilative capacity. Leachate from landfills, severe drawdown from wells in coastal areas, and on-site waste disposal systems contributed to contamination of groundwater aquifers. Major water quality accomplishments during the 1970-1974 period were reported along with cost estimates of providing wastewater treatment facilities through 1990. (Luedtke-Wisconsin)

GREAT LAKES WATER QUALITY; FOURTH ANNUAL REPORT TO THE INTERNATIONAL JOINT COMMISSION.
International Joint Commission-United States and Canada. Great Lakes Water Quality Board.
July 1976. 162 p. 19 tab., 9 fig., 4 append.

Descriptors: *International Joint Commission, Great Lakes, Governments, Canada, Water law, Legal aspects, International waters, International law, Water quality, Water quality control, International commissions, Water pollution effects, Dredging, Land use, Navigation, Toxicity, Toxins.
Identifiers: *Great Lakes Water Quality Board.

A comprehensive review is made of the quality of the U.S.-Canadian boundary waters and of programs and problem areas for which attention is mandated by the countries' Great Lakes Water Quality Agreement. Detailed examinations are provided for nearshore problem areas, programs for the construction of municipal wastewater treatment plants, measures to reduce phosphorus inputs to the lakes and industrial waste treatment programs. Other problem areas covered deal with toxic substances and radioactivity in the Great Lakes and with government programs to reduce their impact on the boundary waters. Dredging, land use and shipping activities are reviewed for their impact on water quality in the region. To mark the start of the fifth year of the agreement, the Great Lakes Water Quality Board presents a proposed framework for completing the implementation of the pact and for improving its effectiveness. Strategies are presented to cope with new problems or with those which might emerge in the future. Revised water quality objectives are proposed, along with an International Great Lakes Surveillance Program designed to provide basic information needed to show progress in achieving the objectives. INFILTRATION/INFLOW - THE KANSAS CONNECTION.
Black and Veatch, Kansas City, Mo.
M. J. Graham, C. W. Duncan, and J. R. Kirby.
Water Pollution Control Federation Highlights, Vol. 13, No. 9, p D2-5, September, 1976. 1 fig, 1 tab.

Descriptors: *Infiltration, *Inflow, *Kansas, *Treatment facilities, *Sewers, Flow rates, Infiltration rates, Cities, *Waste water treatment.
Identifiers: *Infiltration/inflow.

The requirement of PL 92-500 that applicants for federal funds for new treatment works or system improvements must determine any excessive infiltration/inflow, has produced guidelines for such a study. There should be a preliminary infiltration/inflow study and, if an excess is found, a sewer system evaluation survey is required to determine the location, extent, and flow rate of the infiltration/inflow. A summary of several studies conducted for Kansas municipalities is reported. The analyses indicated that sewer cross-connections, broken pipes, defective joints, ill-fitting manhole lids, and manholes located in low areas with lids having holes in them that serve as area drains are probable sources. House service lines, approximately 50% of a sewer system, provide numerous potential infiltration/inflow sources. Several suggestions for improving the situation include plugging sewer lines for razed and/or abandoned buildings, requiring new service from existing sewers to new structures or major remodeling of structures in older areas, replacing broken pipes and sewer lines, and repairing leaking manholes. Increasing pipe diameter by 30% produces an 80% flow increase with little additional costs and may be a useful alternative. This investigation concludes that a substantial part of infiltration/inflow is not readily identifiable or easily corrected and providing holding facilities and treating excessive flow at treatment facilities is more cost effective, generally. It was also noted that the flows on which the studies were based were not reliable and that correction of the situation should be a part of the continuing municipal budget. (Collins-FIRL)

GRANT AID FOR PLANT OPERATIONS: A EVALUATION,
New York State Dept. of Environmental Conse vation, Albany. Environmental Quality Researc and Development Unit.
L. J. Hetling, I. G. Caracich, P. J. Mack, and J. C. Klimek.
Journal Water Pollution Control Federation, Vo 48, No. 11, p 2529-2540, November, 1976. 2 fig, tab, 1 ref.

Descriptors: *Waste water treatment, *Sewa treatment, *Sewage treatment, *Sewera *Treatment facilities, *Grants, New York, Sta governments, Operations, Operation and mai tenance, Construction.

A New York State Legislature study on its pr gram of financial assistance in the constructio operation, and maintenance of waste water tre ment plants was reported. The main goal of t program was to prevent deterioration of new tre ment plants and to upgrade existing ones whe feasible. In evaluating administrative costs, it w found that the program cost $720 thousand a nually or $1 in administrative overhead for ea $25 given in grant. Rising expenditures were co sidered the result of an increase in eligible fac ties, the greater costs of more efficient and co plex plants, and general economic inflation. Ma rejections under the program were due removals less than design or deteriorati removals; lack of action on study and/or c rection of flow measurements, hydrologic ov loading, infiltration or storm water problems; n waste water discharges or bypassing; and adequate or no sampling and/or laboratory testi The program was very helpful in improving sec dary considerations such as plant performance, creasing inspection and repair operations, ma taining qualified personnel without politi overstaffing, inspiring community sewer use dinances, improving safety standards, and aid compliance with pollution abatement orde There are problems with this system which hi hindered full participation by New York commu ties. Some were complicated by community disl of outside inspections and supervision. Oth were financial. In some cases the possible st funds would not be of sufficient benefit in impr ing treatment facilities and, often, costs involv in application for grants were detrimental inh tors. (Collins-FIRL)

INT FORMULATING POINT SOURCE TEGORY EFFLUENT GUIDELINES AND ANDARDS.
vironmental Protection Agency, Washington, C.
deral Register, Vol 40, No 145, p 31724-26, July 1975. 3 p.

scriptors: *Paints, *Waste water treatment, andards, *Water pollution sources, Adminisive agencies, Regulation, Solvents, Incinera, Navigable waters, Recycling, Costs, nomic impact, Federal government, Water lity, Treatment facilities, Water pollution treatnt, Water quality control, Water quality stands, Pollutants, Effluents, Federal Water Pollu Control Act, Industries.
ntifiers: *Administrative regulations(EPA), WPCA Amendments of 1972.

e Environmental Protection Agency (EPA) is ablishing final effluent limitations and delines for existing sources and standards of formance and pretreatment standards for new rces in the oil-base solvent wash paint subegory of the paint formulating point source egory. For this subcategory, no discharge of cess waste water pollutants is allowed either to igable waters or to publicly owned treatment rks since discharge of these pollutants would e a substantial damaging impact on water quali. The EPA notes that currently most plants are discharging process waste water pollutants. ernate treatment methods include solvent overy and incineration. Members of the paint ustry have commented that existing methods not necessarily the equivalent of no discharge ce discharge to a landfill or a municipal treatnt system is a discharge. The EPA further es that recycling was systems reduce the ume of process waste water but do not npletely eliminate it. (Capehart-Florida)

RGINIA STATE PROGRAM FOR CONTROL DISCHARGE OF POLLUTANTS TO VIGABLE WATERS; APPROVAL.
vironmental Protection Agency, Washington, C.
Federal Register, Vol 40, No 9, p 20129-30, May 8, 1975. 2 p.

Descriptors: *Federal Water Pollution Control Act, *Virginia, *Permits, *Water pollution control, Pollutants, Pollutant identification, Water pollution, Water pollution sources, Programs, Federal government, State governments, Legal aspects, Administrative agencies, Regulation, Control, Water pollution effects, Bodies of water, Licenses.
Identifiers: *National Pollutant Discharge Elimination System.

The Environmental Protection Agency has granted the State of Virginia's request for approval of its program for controlling discharges of pollutants to navigable waters in accordance with the National Pollutant Discharge Elimination System (NPDES), pursuant to section 402(b) of the Federal Water Pollution Control Act. Section 402 of the Act establishes a system whereby permit may be issued for discharge of certain pollutants, and section 402(b) allows any state desiring to administer its own permit program for discharges into navigable waters within its jurisdiction to submit such a program to the Administrator for approval. The Virginia NPDES permit program is being administered by the Virginia State Water Control Board. (Hadoulis-Florida)

ORGANIC CHEMICALS MANUFACTURING POINT SOURCE CATEGORY-EFFLUENT LIMITATIONS AND GUIDELINES (AMENDMENTS TO REGULATIONS-BUTADIENE).
Environmental Protection Agency, Washington, D. C.
Federal Register, Vol 40, No 233, p 56435-36, December 3, 1975. 2 p.

Descriptors: *Federal Water Pollution Control Act, *Chemical industry, *Chemical wastes, *Waste water treatment, *Standards, Regulation, Industries, Chemicals, Water pollution sources, Effluents, Pollutants, Water pollution, Water quality, Water quality control, Water quality standards, Administrative agencies, Federal government, Biochemical oxygen demand.
Identifiers: *Administrative regulations(EPA).

The Environmental Protection Agency is amending the regulation relating to effluent limitations and guidelines for the discharge of water pollutants generated by any manufacturing process using oxidative-dehydrogenation of n-butene or butylene. The effluent characteristics for which limitations are established are BOD5, TSS and pH. These guidelines represent the degree of effluent reduction which can be attained by applying the best practicable control technology available at the present time. (Capehart-Florida)
W77-03528

PROPOSED TOXIC POLLUTANT EFFLUENT STANDARDS.
Environmental Protection Agency, Washington, D. C.
Federal Register, Vol 41, No 113, p 23576-96 June 10, 1976. 21 p.

Descriptors: *Federal Water Pollution Control Act, *Pesticides, *Industrial wastes, *Effluents, *Standards, Regulation, Pollutants, Toxicity, Administrative agencies, Federal government, Water pollution, Water quality, Water quality standards, Aldrin, Dieldrin, DDD, DDE, DDT, Endrin, Pesticide toxicity, Public health, Persistence, Waste treatment, Waste water treatment, Water quality control.
Identifiers: *Administrative regulations(EPA), Carcinogens, Toxaphene.

The Environmental Protection Agency has proposed effluent standrads for manufacturers and formulators, both existing and new sources, for the following toxic pollutants: aldrin, dieldrin, DDT, DDD, DDE, endrin, and toxaphene. These substances are among the most highly toxic pesticides known, are persistent in the environment, are lethal to wildlife in low doses, bioaccumulate in aquatic organisms, and pose a threat of cancer to man. The proposed standards allow no aldrin, dieldrin, DDT, DDE, or DDD in any discharge. Permitted levels are established for endrin and toxaphene. Where a toxic pollutant is present in the intake water, an operator will not be required to remove it with the waste water treatment system. (Capehart-Florida)
W77-03529

SECONDARY TREATMENT INFORMATION; BIOCHEMICAL OXYGEN DEMAND, SUSPENDED SOLIDS AND PH.
Environmental Protection Agency, Washington, D. C.
Federal Register, Vol 41, No 144, p 30786-88, July 26, 1976. 4 p.

Descriptors: *Water quality standards, *Regulation, *Water chemistry, *Biochemical oxygen demand, *Coliforms, Water quality, Standards, Water pollution, Water policy, Suspended solids, Administrative agencies, Governments, Disinfection, Legislation, Treatment, Treatment facilities, Waste water(Pollution), Federal Water Pollution Control Act.
Identifiers: *FWPCA Amendments of 1972, pH limitations, Secondary treatment.

The Environmental Protection Agency has proposed an amendment to the Secondary Treatment Information regulation contained in 40CFR Part 133 pursuant to sections 301 and 304 of the Federal Water Pollution Control Act Amendments of 1972. The proposed amendment deleted a section dealing with the limitations for fecal coliform bacteria and added 'special consideration' for clarification of pH limitations. The majority of comments received on the proposed rule changes indicated support for the proposed amendment. The proposed amendment for the deletion of fecal coliform limitations specified reliance on state water quality standards for establishing minimum disinfection requirements for publicly owned treatment works. A significant majority of the responding state agencies, responsible for setting and implementing water quality standards, supported the deletion. The amended version of Part 133 of Chapter I of Title 40 of the Code of Federal Regulations is set forth in the article. (Rieck-Florida)
W77-03530

MARINE SANITATION DEVICE STANDARD.
Environmental Protection Agency, Washington, D. C.
Federal Register, Vol 41, No 20, p 4452-4, Jan 29, 1976, 3 p, 1 tab.

Descriptors: *Ships, *Sewage, *Water pollution, *Standards, *Environmental sanitation, Waste treatment, Boats, Water quality control, Great Lakes, Locks, Freshwater, Estuaries, Coasts, Effluents, Navigable waters, Non-navigable waters, Coliforms, Reservoirs, State jurisdiction, Federal government, Administrative agencies, Bodies of water, Lakes.
Identifiers: *Administrative regulations(EPA), *FWPCA Amendments of 1972.

As required by the 1972 Amendments to the Federal Water Pollution Control Act, the Environmental Protection Agency has established federal standards of performance for vessels on which marine sanitation devices have been installed. Comments from interested parties are included, as well as a table summarizing the federal marine sanitation device standards. The standard for freshwater lakes and non-navigable rivers requires that the marine sanitation devices must prevent

overboard discharge of sewage or sewaged waste. In other waters the standard allows discharge but limits the fecal coliform bacterial count. A state may completely prohibit discharge of sewage into waters within the state by all vessels by making application to the Environmental Protection Agency. The requirements for approval of such as application are detailed. (Capehart-Florida)

THE HARD JOB OF SAVING LAKE ERIE.
Business Week, No. 2404, p 116, October 27, 1975. 1 p, 1 photo.

Descriptors: *Agricultural runoff, *Lake Erie, *Water pollution control, *Phosphorus, *Algae, Bodies of water, Great Lakes, Lakes, Surface waters, Aquatic environment, Aquatic microbiology, Water pollution effects, Water pollution sources, Water pollution treatment, Water quality.
Identifiers: *FWPCA Amendments of 1972.

Lake Erie is a dying lake. The primary cause is the introduction of phosphorus from industrial and municipal sewage discharges and from agricultural runoff. Phosphorus stimulates the growth of algae, which die and decompose in late summer. The decomposition consumes all the dissolved oxygen in the lake's cool lower stratum. This condition, known as anoxia, lasts until the entire lake cools in autumn. The anoxia, in turn, causes a reaction that pumps up more phosphorus from the bottom sediments, which stimulates the growth of more algae. The lake is choking on its own regenerated pollution. Studies have been done in conjunction with the Water Pollution Control Act amendments of 1972 showing that costs to implement the required 'best available technology' will run over two billion dollars. While slow improvement is forecast, the future is not bright for a lake that has aged 15,000 years in the last 200. (Frank-Florida)

FEASIBILITY OF TRANSPLANTATION, REVEGETATION, AND RESTORATION OF EELGRASS IN SAN DIEGO BAY, CALIFORNIA,
Army Engineer Waterways Experiment Station, Vicksburg, Miss. Environmental Effects Lab.
C. G. Boone, and R. E. Hoeppel.
Available from the National Technical Information Service, Springfield, VA 22161 as AD/A021 484, Price codes: A03 in paper copy, A01 in microfiche. Miscellaneous Paper Y-76-2, February 1976. 47 p. 3 fig., 1 tab., 44 ref., 2 append. DACW09-75-B-0026.

Descriptors: *Marine plants, *Revegetation, Environmental effects, Feasibility, Costs, Shores, *California, Plant growth, Spoil banks, Bays, Methodology.
Identifiers: *Eelgrass, *San Diego Bay(Calif), Zostera marina, Dredge spoil disposal, Transplantation.

The state of the art of eelgrass (Zostera marina L.) revegetation methodologies were evaluated in order to examine the possibility of preserving or replacing the eight-acre Delta Beach eelgrass bed programmed to become a dredged material disposal site. Feasibility of various transplantation and revegetation methods were considered along with site selection criteria, substrate-nutrient effects, temperature, light, and salinity effects, and eelgrass productivity and nutrient recycling. It is suggested that the eelgrass turions be harvested during the winter months prior to filling the dredge disposal site and broadcast into other areas of south San Diego Bay where patchy eelgrass beds already exist. Replanting of the Delta Beach areas should be postponed for a minimum of a year after filling, to allow the substrate to become stabilized and consolidated. The plug method, an alternative approach to the turion method of transplantation, would likely be more productive, but being more labor-intensive would also be more costly. A comparison of the respective costs of these two methods is appended. It is also recommended that a pilot study be undertaken to more accurately determine the most cost effective and productive procedures. (Luedtke-Wisconsin)

Federal effort to achieve clean water culminated in the Federal Water Pollution Control Act Amendments of 1972. These amendments were thought to be the most comprehensive ever, capable of restoring and maintaining the chemical, physical and biological integrity of the nation's waters. After seemingly endless optimism, the judgment is that, so far, the program has yet to get off the ground. Major criticism has been aimed at the principal administrator of the program, the E vironmental Protection Agency (EPA). Specif charges have been levied that guidelines promu gated by EPA are too complex and too far behi schedule, paperwork required is too extensive a that promised funding has not been forthcomin Only half of the desired money for sewage trea ment construction grants has been released a then only after numerous court battles. The e fluent guidelines have not been promulgated schedule and toxic pollutant standards have be virtually nonexistent. EPA has responded that t complexity of the program and the short time which they were given to carry it out h prevented smooth implementation of program po icies. (Welch-Florida)

Examined here are the problems affecting the N tional Pollutant Discharge Elimination Syst (NPDES) permit program. The program, which administered by the Environmental Protecti Agency, is intended to clean up the nation's wat ways through issuance and enforcement of p mits which define allowable effluent limitatio Legislation requires that compliance with the limits be met by July 1, 1977. However, t deadline may be unrealistic in light of three ma problems confronting the program. First, a U. district court has ruled that the Environmen Protection Agency (EPA) must issue permits to major and minor point source polluters. Becau the Government Accounting Office believes t compliance with this ruling would present an most impossible task it suggests new legislat giving the EPA the power to exempt minimum fect polluters. The second factor affecting tim implementation of the program is that many ind trial law suits have been brought challenging reasonableness of the permit requiremen Thirdly, the report states that insufficient fede funding has prevented many municipalities fr constructing or upgrading their discharge faciliti Further, since neither the EPA nor the states p to take enforcement actions against the m nicipalities, it is recommended that the deadl for municipal compliance be extended on a ca by-case basis. erve Mining Company of Silver Bay, Min-
ota has been dumping 750 million gallons of
tewater, 67,000 tons of taconite waste, and
00 pounds of dissolved solids into Lake Su-
or each day. When the company was granted
ermit in 1947, it was forbidden to do much of
t it is doing today. The Save Lake Superior As-
ation (SLSA) took the company to court, and
974 a District Court judge ruled that Reserve
uld be enjoined from continuing discharge. The
that carcinogenic asbestos fibers were found
e waste played a large part in the decision. The
judge's injunction was stayed by an appellate
rt, however, and on appeal the United States
reme Court refused to overturn the stay. In-
d, it urged that administrative solutions be
ght. Unfortunately, this will prove a lengthy
ess due to Reserve's intransigence. Presently,
vampy area downlake is being studied as a
ntial land site for dumping. Obviously, some
rnative to outright lake dumping must be
nd. The question raised here is whether
eral, state and corporate authorities regard the
blem as one requiring immediate solution.

sphatic clay ponds in Florida pose a serious
at to the environment. Held behind earth
s, they always have the potential to escape
heavily pollute any nearby waterways.
ause of the damage that has been caused by
nt dam failures, such as the Fort Meade Mine
971, the phosphate industry has investigated
r methods of containing and removing such
sphatic wastes. Three major methods are ex-
ed: dewatering techniques, filtration, and
s-flow fluid bed dryers. While several de-
ering techniques are technically feasible, such
reezing and solar evaporation, they have not
en economically feasible. Two methods, how-
, appear to be technically and economically
ible: straight mixing with tailings sand; and
nical flocculation together with coagulation
tailings sand. Both methods are currently un-
going field testing. Field testing is also planned
a new filtering system. In the past, filtering
ems were plagued by clogging or blinding of
filter media. The University of Florida has ap-
ntly developed a new system that avoids these
blems. Another new development concerns the
dryer, which can dry slimes of 30% solids to a
der of 95-99% solids content with 75% fuel ef-
ncy. The major problem with this method is in
atering slimes to 30%. Hopefully, one of these
hods will obviate the need for environmentally
fe phosphatic slime ponds. (Frank-Florida)

**WYOMING WATER QUALITY ACT AND
FEDERAL WATER POLLUTION CON-
L ACT AMENDMENTS OF 1972: A COM-
ISON,**
. Orf.

Land and Water Law Review Vol 9, p 79-95 (1974). 17 p, 95 ref.

Descriptors: *Water quality act, *Water pollution sources, *Permits, *Wyoming, *Governmental interrelations, Penalties(Legal), Discharge(Water), Regulation, Water quality standards, State governments, Administrative agencies, Sewage treatment, Federal water pollution control act, Effluents, Interagency cooperation.
Identifiers: *FWPCA Amendments of 1972.

The 1972 Amendments to the Federal Water Pollution Control Act authorized states to administer their own conforming permit programs. This article covers Wyoming's legislation directed toward that program, examines the compliance of the Wyoming act with federal requirements and predicts what further administrative regulation will be necessary to meet federal standards. Both the state and national acts set up a permit system for water pollution sources, with general limitations on the release of effluents. Also examined are the procedural process for permit application and how specific limitation standards can be developed. Required federal regulation which have been adopted by the state include provisions for public participation in the permit process, procedures for hearings, and the release of application information. The state acts compliance with federal regulations for terms and conditions of permits and of variance concessions will need administrative augmentation. The state is given authority to monitor pollution sources; enforcement provisions are included.

Descriptors: Water supply, Planning, *Systems analysis, Optimization, *Regional analysis, Model studies, *Municipal water, Costs, *Linear programming, *Alternative costs, *Investment, Capital costs, Operating costs, Maintenance costs.
Identifiers: Interactive data, Mixed integer programming.

An interactive data and model generator is developed that is intended to bridge the gap between planning engineers and the mathematical programming systems approach to municipal and regional water supply planning. The optimization objective is to minimize total annual cost of existing and future alternative source-related water supply facilities with respect to capital investment and operation and maintenance costs. A matrix generator is developed which formulates the necessary hydrologic, demographic and stochastic municipal water supply data into the format of a mixed integer linear programming problem for system optimization. The program then calls the integer programming algorithm, solves the optimization problem, and outputs a report in a format and language designed specifically for the problem at hand. All of this is accomplished in interactive mode with the user simply answering questions which are asked by the program.

USE OF HYBRID COMPUTER MODEL IN RESOURCE PLANNING,
Central and Southern Florida Flood Control District, West Palm Beach.
G. Shih.
In Depth Report, Vol 3, No 2, p 1-12, Feb 1976. 12 p, 11 fig.

Descriptors: *Computer models, *Hybrid computers, *Water resources, *Model studies, *Planning, Simulation analysis, Water supply, Flood protection, Pollution control, Water pollution, Aquifers, Lakes, Structures, Groundwater, Saline water intrusion, Soil contamination, Analog models, Mathematical models, Digital computers, Systems analysis, Drawdown, Droughts.

Water resource planning requires consideration of a number of factors such as water supply, flood protection, pollution control, and environmental protection. Computer modelling is a widely used tool for studying such complex planning systems. The author suggests use of a hybrid computer, a combination of both a digital and an analog computer, as a feasible means for evaluating resource planning alternatives. The convenient and flexible input-output features and the data manipulation capability of the digital computer are complemented by the continuous solution capability of the analog computer. Analog groundwater simulation models have been used for analysis of draw downs, droughts, and developments of regional impact. A hybrid model has been used to simulate problems of salt water intrusion. Water resource problems which may be appropriate for hybrid modelling are surface water systems, soil and water pollution interactions, and ecological systems. (Capehart-Florida)

USEFUL MODELING CONCEPTS FOR THE FCD WATER SYSTEM,
Central and Southern Florida Flood Control District, West Palm Beach.
A. N. Shahane, and R. L. Hamrick.
In Depth Report, Vol 2, No 4, p 1-12, Sept-Oct 1974. 12 p, 3 fig, 2 tab.

Descriptors: *Simulation analysis, *Analytical techniques, *Hydrologic systems, *Water allocation(Policy), Systems analysis, Linear programming, Water sources, Computers, Water levels, Non-structural alternatives, Computer models, Flood control, Flood routing, Drainage systems, Water management(Applied), River basin development, Artificial water courses, Water resources development, Aquifers, Rainfall simulators, Statistical models.

The water system included in the flood control district is a modified, controlled system rather than a natural system. Therefore, it is not possible to

apply the techniques of conventional engineering analysis of natural streamflows to the system. Examples of the types of modeling concepts which are applied to the system are presented. One such concept involves the coupling of a linear programming water allocation model with a model simulating a specific river basin system. Analysis of operational policies regarding water regulation schedules is achieved by a simulation process which links the models of various water sources and water uses. Another model is a hydrologic model which simulates the effect of rainfall on the streamflows. A routing model which uses output from the hydrologic model provides information on discharges, water levels, and storage at different points in the system. A table is included which shows the present status of modeling activity in the flood control district. Fourteen models are tabulated with their type, field, and area of application. (Capehart-Florida)

6B. Evaluation Process

LOCAL WATER SYSTEMS ARE FREQUENTLY NEGLECTED,
Illinois Univ. at Urbana-Champaign. Dept. of Agricultural Economics.
J. C. Van Es, and R. J. Quigley.
Small Town, Vol 7, No 2, August 1976, p 4-6. OWRT A-075-ILL(3), 14-31-0001-5013.

Descriptors: *Management, *Decision making, *Municipal water, Potable water, *Illinois, *Planning.
Identifiers: *Local planning.

On the basis of detailed questionnaires on municipal public drinking water systems given to 228 incorporated Illinois communities, the investigators concluded, among other things, (1) that the lines of communication among those responsible for water systems operations are frequently poor, (2) that financial information on a system's operation is often missing or unknown by those who set the rates, (3) that many municipalities (45%) do not engage in formal planning, and (4) that many systems (27%) have no procedures for such common emergencies as low water pressure. The investigators warn that unless local communities begin to take the initiative and eliminate these problems, unwanted federal and state intervention will become more and more necessary.

WATER MANAGEMENT AND REGULATION OF WATER USE,
Central and Southern Florida Flood Control District, West Palm Beach.
A. Kreitman.
In Depth Report, Vol 3, No 1, p 1-12, April 1975. 12 p. 5 fig, 2 tab.

Descriptors: *Florida, *Hydrologic budget, *Water allocation(Policy), *Water permits, *Groundwater resources, Water management(Applied), Consumptive use, Water districts, Evapotranspiration, Rainfall, Recharge, Potable water, Irrigation, Planning, Saline water intrusion, Water requirements, Water supply, Water conservation, Water utilization, Aquifers, Water sources.

The regulation of consumptive water use is one of the factors involved in water management. The flood control district of south Florida is engaged in formulating a plan to provide water resources to the many competing uses in a consistent manner A water budget has been designed which establishes the long term sustained yield of the water basin. This safe yield is defined as the average annual recharge to the ground water system which is equivalent to the annual rainfall minus the annual evapotranspiration. Several examples of application of the water budget principle are given. One involves a request for an agricultural water use permit. The technique demonstrates that the amount of water requested substantially exceeded the amount actually needed. Therefore, a much smaller amount was permitted. Other studies relate to requests from municipalities for increases to the water supply systems. The possibility of salt water intrusion in the well field caused by additional wells was analyzed and it was recommended that different locations be used for the wells. (Capehart-Florida)

THE OBJECTIVES, PART I OF THE STA WATER PLAN, (IDAHO WATER RESOURC BOARD).
Idaho Water Resource Board, Boise.
June 1974. 49 p. 5 fig., 2 tab.

Descriptors: *Idaho, *Comprehensive planni *Water management(Applied), *State gove ments, Rocky Mountain region, Planning, Lo term planning, Water resources developme River basin development, Multiple-purpose p jects, Social aspects, Legal aspects.
Identifiers: Snake River(Idaho).

An initial report identifies and defines the polic and objectives which the Idaho Water Resou Board has adopted to govern the planni development and conservation of the state's wa and related land resources. This report of obj tives will constitute, along with subsequent dividual reports covering projects and progra necessary for the state's three main river ba areas, the Idaho State Water Plan. Described this report are interfaces among the state's natu resources as they relate to water use. These clude land, water, geothermal water, miner timber, fish and wildlife. Other resource fact discussed are population, the economy, empl ment and personal income. Thirteen statement objectives are delineated in the report, with e describing a facet of water planning philoso that is intended to become mandatory for fut governmental and private activities in the s which impact on water resources. Objective ar are: beneficial and efficient water use, elec energy, environmental quality, erosion and s mentation control, fish and wildlife, aquacultu flood damage reduction, agriculture, Indian la and related water resources, interbasin w transfer, recreation, state-federal rights, and w and scenic rivers. WATER FOR NEVADA. WATER PLANNI REPORT.
Nevada Div. of Water Resources, Carson C Office of State Engineer..
Special Summary Report, November 1974. 24 p

Descriptors: *Nevada, *Comprehensive planni *Water management(Applied), *State gov ments, *Reclamation states, Southwest U Planning, Long-term planning, Water resou development, River basin development, Multi purpose projects, Social aspects, Legal aspects
Identifiers: *Nevada State Water Plan.

Description is given of the information contai in detailed reports and supporting material wh constitutes the state's comprehensive water p The legislative background and plan procedures of the overall effort are descri along with summaries of each of 16 'Water Nevada' reports issued since January 1971, an ports of 'Alternative Plans for Water Use' co ing six river basin areas into which the state is vided for water resource planning purpo General findings, conclusions and recomme tions are covered, along with separate conclus and recommendations for the individual r basin areas. Conclusions and recommendation projected water requirements are given for nicipal and industrial water use, electric en generation, mining, recreation, agriculture, and wildlife. The general conclusions and rec mendations cover water law and administra procedures, funding of water resource proje local options and discretion, mining or depletio

d water, transbasin diversions, preferred
reservation of water quantities, termed ap-
l of water appropriations, water supplies and
for temporary construction uses, wells for
stic use, taxes on well production, geother-
resources, subdivision water supplies,
federal jurisdiction, flood control, navigabili-
nvironmental considerations and continuing
ing efforts. (Harris-Wisconsin)

fiers: Upper Mississippi River Basin, Mis-
River Basin.

neral program overview is described for
oping a statewide plan for the orderly
opment, use, protection and conservation of
and related resources in Iowa. Included are
ations of facts justifying a comprehensive
plan, and a general description of the state's
ble water resources--including discussions
imatological factors, streamflow, floods,
dwater, geologic and hydrologic considera-
and general water quality characteristics of
tate. Interrelationships are examined for
supply, water quality control, agricultural
production, flood plain occupancy and
gement, water-oriented recreation, fish and
e resources, navigation and energy produc-
Historical aspects of water policy develop-
in Iowa are summarized, and the state's in-
e with Missouri and Upper Mississippi in-
te river basins is examined. An organiza-
and institutional flow chart is given in which
ynamics of water and related resources
ng are graphically described. Findings and
mendations are listed for studies of existing
water policies and laws, public participation
s, urban versus rural water supply needs,
water treatment, watershed problem identifi-
and ranking, and program funding on multi-
mental levels. (Harris-Wisconsin)

ptors: *California, *Water utilization,
, Surveys, Data collections, Prices,
ng, Urbanization, *City planning.

ly water use data for 147 water service
es throughout California for the period
en 1961 and 1970 is presented. Analysis of
ta indicates that, in 1970, California urban
nts and manufacturing industries together
n average of 4.3 billion gallons of fresh
per day or about 13% of the total freshwater
ariations in unit water use among the 11
ogic study areas along with the magnitude
-supplied water use in some areas are illus-
Unit use is exceptionally high in the North
l and North Lahontan areas due to a small
tion base and high industrial water use. An-
ater use by county is illustrated as are coun-
nthly and annual unit water use for 1966
h 1970, except for industry-produced water
was ascertained only on an annual basis. A
ry of annual per capita water use within in-
l cities and agency boundaries is included,
as well as the average retail price range for water in 1970. The basic records of monthly unit water use for 1960 through 1970, which provide the main statistical array of data to use in making peak monthly demand projections is also included. Most of this data is graphic or in statistical form. (Luedtke-Wisconsin)

THE CALIFORNIA STATE WATER PROJECT IN 1975.
California State Dept. of Water Resources, Sacramento.
Bulletin No. 132-75, June 1975. 192 p, 17 fig, 12 tab, append.

Descriptors: *Facilities, Hydraulic structures, *Water management(Applied), *Water resources development, *Water distribution(Applied), *Multiple-purpose projects, *California, Dams, Impoundments, *Aqueducts, Water conveyance, Pumping plants, Hydroelectric plants, Powerplants, Long-term planning, Legal aspects, Financing, Recreation, Construction, Administration.
Identifiers: California Aqueduct.

The progress to 1975, current status and future plans of California's Water Project, including the 444-mile aqueduct, are summarized and reviewed, with specific reference made to construction of dams and reservoirs, power plants, supplemental aqueducts and pumping stations. Information is provided concerning the history of the project, project construction, project utility management, operations, visitor use, recreation/fish/wildlife use and project financing. Seventy-six percent of the project facilities scheduled for completion by the end of 1985 were under construction or completed by the beginning of 1975. These facilities include 23 dams and reservoirs, eight power plants, 22 pumping stations and 684 miles of aqueducts. Detailed information is given for actions concerning project power, water supplies, recreation/fish/wildlife enhancement; litigation; construction plans, specifications, land acquisition, relocations and building progress; management of water rights, water contracts and power contracts; project operations among the various field divisions; construction expenditures and other capital requirements; operating revenues; miscellaneous receipts and capital requirements. INVESTIGATION OF THE PHYSICAL FEASIBILITY OF MOBILE FISH PROCESSING PLANTS,
Fisheries and Marine Service, Ottawa (Ontario). Research and Development Directorate.
W. L. Dilk.
Technical Report No. 634, 1976. 29 p, 12 fig, 1 append.

Descriptors: *Canneries, Fish handling facilities, *Economic justification, Fish harvest, Commercial fish, Commercial fishing, Food processing industries, Pollutants, Industrial wastes, Facilities, Capital costs, Cost analysis, Estimated costs, Canada, Economies of scale, Waste disposal.
Identifiers: *Mobile facilities, Bio-drum liquid effluent disposable system, Mobile processing units.

A study in Canada to determine the physical feasibility of building mobile fish processing plants indicates that systems made up of three mobile subunits each can be utilized for defleshing, block freezing operations, cold storage, power supply and optional liquid effluent disposal. However, further studies are needed to relate economic feasibility of the units to their 10 year life expectancy, along with analysis of production constraints, capital costs and space limitations inside the units. The mobile fish processing concept is designed as a partial answer to quota systems applied to certain lakes that constrain development of permanent facilities, and as a solution to the problem of underutilized species such as mullet which are harvested on a seasonal basis. Detailed technical data are given for plant specifications such as mechanical and electrical systems, refrigeration, process equipment and product transportation. Logistics and production capabilities are described, and capital costs are compared with capital reduction options made possible by deletion of certain equipment items or by use of partial leasing arrangements. General producation parameters and considerations, along with physical plant capacities, are summarized. (Harris-Wisconsin)

THE STATE OF UTAH WATER - 1975,
Utah Div. of Water Resources, Salt Lake City.
B. C. Saunder.
January 1976. 72 p., 9 fig., 2 tab., 10 ref.

Descriptors: *Utah, *Comprehensive planning, *Decision making, *Water allocation(Policy), Projections, Colorado River Basin, Colorado River, Water demand, Water rights, Competing uses, Electric power production, Cooling water, Irrigation, Industries, Financing, Oil shales, Water resources development, Cloud seeding, Consumptive use, Water supply.
Identifiers: *Utah water plan.

This third general status report on the comprehensive water planning process in Utah addresses the current issues and the water planning process itself. The major water resources planning problem in this water-deficient state is one of economics, that is, projects which are technically and physically feasible are often beyond the means of the potential users to pay the costs. The emphasis is directed toward determining and placing in priority the most pressing water-related needs and taking appropriate action to meet those needs. The major water policy issues facing state planners are goals and objectives, water allocation, and the use of the Colorado River water as related to socio-economic values and environmental concerns. The guiding prinviple of the planning process is directed toward optimum use of water resources by including concepts of multiple use of facilities, sequential water use and reuse. Among the water allocation considerations are the requirements for coal mining, coal-fired power plants, oil shale development, and financing. About 47% of the state has been cloud seeded and it is anticipated that the major mountain watersheds will be seeded within the next few years. Water derived from cloud

seeding is regulated by existing water rights. Cloud seeding is considered an integral part of the state water plan and may be the only method to provide an additional water supply in areas where economic restrictions prohibit physical conveyance systems to be built. (Auen-Wisconsin)
W77-03559

IOWA WATER RESOURCES FRAMEWORK STUDY PLAN OF STUDY.
Iowa Natural Resources Council, Des Moines. Technical Coordinating Committee.
August 1975. 26 p, 3 fig, 4 tab.

Descriptors: *Water management(Applied), *Iowa, *Planning, *Water resources development, Comprehensive planning, State governments, State jurisdiction, River basin development, Institutions, Local governments, Non-structural altern ives, Water law, Water policy, Programs, Methodology, Projections, Scheduling, Budgeting, Social aspects.
Identifiers: Citizen participation, Public information, Problem identification and ranking.

Iowa's comprehensive state water resources plan is outlined, including a statement of goals and objectives, description of the study area, and framework descriptions of the study organization and management, strategies for public participation and information, and initial ideas for the process, scheduling and budget of the plan. The framework study, based on existing data, is the first part of the state's long-range water resources planning process. The study identifies needs, along with existing and potential problems, outlines current and potential demands on the resources, suggests programs and remedial measures and suggests policies from which fundamental philosophy of water resources management and allocation will be derived for use by the appropriate state agencies. Time-table activities under the plan are scheduled from July 1975 through June 1978 for the framework study. Work assignments are made for individual segments of the study work effort: data base and needs, water resources availability, socioeconomic/legal/institutional trends, water use, water quality management, water-oriented fish and wildlife resources, energy production and navigation. REHABILITATION OF PAMLICO SOUND OYSTER PRODUCING GROUNDS DAMAGED OR DESTROYED BY HURRICANE GINGER,
North Carolina Div. of Marine Fisheries, Raleigh.
F. H. Munden.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-246 966, Price codes: A03 in paper copy, A01 in microfiche. Special Scientific Report No 27, May 1975. 36 p, 19 fig, 3 tab, 7 ref. NMFS 2-173-D.

Descriptors: *Oysters, *North Carolina, Shellfish farming, Hurricanes, Rehabilitation.
Identifiers: *Pamlico Sound(NC), Oyster beds.

The North Carolina Pamlico Sound oyster beds, damaged by Hurricane Ginger in 1971, were rehabilitated to prevent losses to more than 700 fishermen. The focus was to reseed shell stock and/or marl to compensate for the mortality of small oysters and to reestablish base rocks in these traditionally high quality grounds. Oyster rehabilitation began in June 1972 with plantings of 69,000 bushels of fresh oyster shells as cultch and 86,000 bushels of marl, using a formula of 500 to 750 bushels per acre, with the higher planting rates in deeper water. Sampling of spat set after six months indicated good winter survival and normal to excellent growth in the southern Pamlico Sound areas but lower spat sets in the northwest areas. Approximately 24,000 bushels of seed oysters were planted in the less productive areas in 1973, employing local and commercial fishermen. All shell plantings showed successful rehabilitation. Marl spat set was more irregular with lower winter survival than on shell. Seed oysters were procured as additional cultch material and stock from near the entrance to Pamlico River where they seldom grew to legal harvestable size. It was believed that oyster growth there was retarded by the large amount of fresh water runoff. (Auen-Wisconsin)

HURDLES IN THE PATH OF COASTAL PLAN IMPLEMENTATION,
G. Bowden.
S. Cal. L. Rev., Vol. 49, No. 4, p. 759-71 (1976). 13 p.

Descriptors: *California, *Comprehensive planning, *Political aspects, *Governmental interrelations, Regional development, Non-structural alternatives, Economic efficiency, Water resources development, Local governments. Regulation, State governments, Planning, Multiple-purpose projects, Legislation, Decision making.
Identifiers: Coastal waters, Coastal zone management.

The article considers three impediments to implementation of the California Coastal Plan: the plan's broad scope; problems with clarity of wording; and reliance on local governments for execution. Unusual provisions for coastal zoning and controversial changes in tax structure may undermine public support for the plan and block its legislative passage. In addition, it is not clear that the technical knowledge necessary to implement the plan's goals exists. Some economic-cost criticism has been directed at the plan, but it is not totally justified. Ambiguity of terms is a problem for the plan; and the currently proposed implementing statute does not alleviate this problem. There may be some difficulty with local government implementation since local entities played no role in policy-formation for the plan. Furthermore, the plan does not provide a blueprint for a system of arbitrating conflicts between state and local officials; some provision must be made to facilitate consultation and cooperation. Thus, legislative revision aimed at a solution for intergovernmental conflict, and focusing on key issues of the plan would increase its chances for passage. (Molloy-Florida)

A COMPUTER PROGRAM FOR ESTIMATING COSTS OF OWNING AND OPERATING AN IRRIGATION WELL UNDER CONDITIONS OF DECLINING WATER LEVELS,
Washington State Univ., Pullman. Dept. of Agricultural Economics.
M. Feldman, and N. K. Whittlesey.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-262 398, Price codes: A04 in paper copy, A01 in microfiche. August 1976. 65 p, 1 fig, 4 tab, append. OWRT B-051-WASH(1). 14-31-0001-3945.

Descriptors: *Groundwater, *Conjunctive use, *Computer programs, *Estimating costs, *Irrigation wells, Water levels, Costs, *Washington, Model studies, Pumping, Withdrawal, Investment.

A computer program for calculating cost per acre-foot of groundwater under a wide range of specified conditions is described. The existi model applies to conditions found in Adams, L coln, and Grant Counties of eastern Washingt The cost calculations are based on 1973 prices. supplying other prices, tax rates, and power cos the model could be generalized to other times a places. The model does not consider the effects federal income taxes on the real costs of the w investment. The well conditions specified in model include rate of decline of static water le (SWL), capacity, surface head required, month pumping season, aquifer transmissivity, inter rate on invested capital, and permitted decline terval for pump replacement. The model de mines what well and pump equipment will required initially and at replacement intervals. initial purchase cost, and real owning and ope ing costs, are displayed each time new equipm is required. The model calculates costs as production were to cease each time new equ ment is required. The new equipment is added the model then estimates the marginal costs continuing to operate. Per acre-foot costs discounted at various interest rates to obtain t present value.

WATER RESOURCES OF AUSTRALIA A THE PATTERN OF POPULATION CONC TRATIONS,
J. W. Holmes.
National Population Enquiry Research Report 4. Australian Government Publishing Serv Canberra, 1976. 24 p., 2 fig., 15 tab.

Descriptors: *Human populations, *Distribu patterns, *Water requirements, *Water resour *City planning, *Australia, Water supply, W quality, Data collections, Urbanization, Consu tive use, Water utilization.
Identifiers: Albury-Wodonga(NSW-Vic), Mo to(SA), Dampier(WA).

Determination of the urban population which be supported by the water supplies of a give gion involves not only the total consumptive us water, but also the initial quality of the w supply, the possibility of reusing treated effl and the need for a minimum dilution flow to pollution of downstream waters by effluent w acceptable limits. Available data on all these tors for current Australian urban centres are lected and reviewed to derive quantitative pr ples for the planning of future population cen These principles are then applied in detail to t presently-proposed urban growth centres; and general way to derive a maximum-permiss population map of Australia, based on drai divisions. The conclusion reached is that tralia's water resources could support a pote maximum population of about 280 mil (CSIRO)

tifiers: Demography.

extensive set of demographic, economic, and r use projections for Iowa from 1975 to the 2020 are reported. Past historical trends in the economy at the county level were analyzed then synthesized with a set of national projec-for multi-county sub-national nodal omic areas of the United States which were ered on major urban economic areas, in order evelop the Iowa projection series. Results in-e that the population will grow at the rate of %/year from 1975 to 2020, increasing from ,000 to 3,217,000. Employment will increase out double the rate of population with most of increase in labor force participation coming an increasing number of women seeking em-ment. An increase in productivity per worker yield a 2.71%/year increase in real per capita ne. Development of water use estimates in-ed consideration of water intake, gross use, arge, and consumption. Water use was fused e state input-output model and the concepts of industry water relationships and water mul-rs were also introduced. Iowa's water intake rements are expected to increase at the rate 6%/year, with the electric utility, manufactur-agricultural and residential sectors expected nain the heaviest users. fiers: *Sacramento County(Calif), Demog-

ugh Sacramento County, California will have water than it needs for the sum of all an-ed uses from the present time until 2020, ac-upplies available to individual water pur-s will not be proportional to specific pro-demands, and concomitant shortages and ances may be expected. At present, about he county's water supply comes from the d water basin, levels of which have been cu-vely lowered since 1940. In a review of de-data, future population, land use and water ements are projected for 45 years. Using the ted data and a mathematical model of the d water basin, five examples of operational ement plans are simulated--ranging from 100% ground water pumpage to a maximum possible use of surface water. The results indicate that a stable ground water basin can be achieved by use of approximately 58 to 60% surface water. Recommendations call for specific plans to implement the movement of additional water supplies to areas of need, to increase surface water use to save ground water supplies, and to replenish the ground water level by making certain institutional changes impacting on water use in the county. The plan would involve cooperative action between the county government and local water purveyors. (Harris-Wisconsin)

Utah Div. of Water Resources, Salt Lake City.
For primary bibliographic entry see Field 6B.
W77-03559

THE STATE OF UTAH WATER.
Utah Div. of Water Resources, Salt Lake City.
September 1972. 20 p.

Descriptors: *Water resources development, *Utah, *Water allocation(Policy), *Future planning(Projected), Water utilization, Inter-basin transfers, Groundwater resources, Hydrology.

The current status of Utah's water resources is summarized and the inherent choices available to meet desired industrial and municipal growth, stabilization of existing rural communities, preserving and/or enhancing recreation and wildlife areas, and creating an institutional and management structure that will encourage effective water allocation and use are generalized. It is estimated that there is 2.5 million acre-feet of surface water available for new uses, 400,000 acre-feet of groundwater, and a 1.5 million acre-feet annually for 50 years of relict water stored in underground reservoirs. Present and future (2020) water use by hydrologic area are computed and alternatives such as inter-basin transfers and desalination are considered, as are potentials for local hydrologic development. The greatest impacts on the state's water resources are water allocation and financing for which the present legislation gives few guidelines. And because the legislation is based on the precept that the state should assist any legitimate water development, its validity is inapplicable to the projected water demand. To allow officials to make defendable choices among potential competing users, at an acceptable cost, comprehensive legislative guidelines are required. (Auen-Wisconsin)

Available from the National Technical Information Service, Springfield, VA 22161 as PB-262 382, Price codes: A08 in paper copy, A01 in microfiche. Interim Report, September 1, 1976. 166 p, 3 fig, 1 tab, 2 append. OWRT A-080-WASH(1). 14-34-0001-6050.

Descriptors: *Water policy, *Public rights, *Electric power, Energy, *Pacific nortwest(US), Water resource development, Legal aspects, *Institutions, *Alternative planning, *Electric power production.

Pacific Northwest regional electric power development has been studied with three objectives: (1) to assemble an historical account of institutional arrangements for electric power development in the region; (2) to identify emergent public policy issues; (3) to identify long-range institutional research problems relevant to regional energy and resource development. The historical path of electric power development, stemming from the 1937 Bonneville Project Act, importantly shapes the institutional constraints and opportunities available today. The most important of these is the institutional framework in which the growth of a combined hydroelectric and thermal generating system of regional scale is to be planned, financed, and implemented. The choices have fundamental, long-term -- and yet not publicly visible -- implications for the economic, environmental, and political future of the region. Some developing mechanisms for articulating the political choices -- and controversy -- are evaluated and compared with alternatives.

COLORADO WATER QUALITY CONTROL ACT.
Colo Rev Stat Ann secs 25-8-101 thru 25-8-704 (1973).

Descriptors: *Adoption of practices, *Colorado, *Water quality, *Water pollution control, *Permits, Water law, Water treatment, Pollution, Water pollution treatment, State governments, Water quality control, Water quality standards, Sampling, Water pollution sources, Legal aspects, Legal review.

To preserve the quality of state waters, the Colorado legislature has established a water quality control commission authorized to promulgate and enforce water quality standards. The commission is also authorized to issue waste discharge permits, classify state waters, review applications for underground discharges and review local governmental regulations for individual sewage disposal systems. Sampling, monitoring, recording and reporting shall be done in an effort to detect and remedy water pollution. Authority is granted to enter, in a reasonable time and manner, all lands for investigation of sources of water pollution, as well as to conduct research studies with respect to water pollution. All regulations, standards and decisions shall be subject to judicial review. Regulations for permits are established, and the commission is given the power to construct all necessary pollution facilities. Penalties for violation of these regulations are delineated. (Frank-Florida)
W77-03490

INDIVIDUAL SEWAGE DISPOSAL SYSTEM ACT.
Colo Rev Sta Ann secs 25-10-101 thru 25-10-112 (1973).

Descriptors: *Colorado, *Sewage treatment, *Sewage disposal, *Regulation, Legislation, Standards, Administrative agencies, Local governments, Permits, Penalties(Legal), Law enforcement, Septic tanks, Inspection, Treatment facilities, Installation, Maintenance, Performances, Percolation, Design criteria, Building codes, Effluents, Evapotranspiration.

The Colorado state board of health is required to adopt guidelines providing minimum standards for the regulation of individual sewage disposal systems. Local boards of health must adopt guidelines for their areas of jurisdiction which comply with the state guidelines. Such guidelines must cover all aspects of performance, location, construction, alteration, installation and use of individual sewage disposal systems. Rules must be adopted governing procedures for the application for and issuance of permits, the inspection, testing and supervision of installed systems, the issuance of cease and desist orders, the maintenance and cleaning of systems, and waste disposal. Local boards may require licensing of systems contractors and systems cleaners. The primary responsibility for enforcement of the regulations is placed on the local agencies. (Capehart-Florida)

FLOATING TIMBER ON STREAMS.
Colo Rev Stat Ann secs 36-8-101 thru 36-8-110 (1973).

Descriptors: *Colorado, *Lumber, *Lumbering, *Permits, Rivers, Streams, Appropriation, State governments, Legislation, Legal aspects, Licenses, Administrative agencies, Administrative decisions, Water law, Water use.

Colorado has enacted legislation providing that all state streams can be used for floating logs or timber subject to prior rights of appropriation. A permit must be obtained from the state engineer, however, stating the location of the stream, as well as the booms or structures of all appropriators on the stream. Thirty days after filing, a hearing is held where concerned parties may object. The state engineer may modify or deny a permit if the work will cause damage to existing structures. In addition, the applicant shall post a security bond, but approval by the state engineer does not relieve him from liability for damage. Finally, objections to the hearing result may and should be taken to the district court in the county where the log-rolling is to take place. (Frank-Florida)
W77-03492

SPECIFIC GRANTS OF POWER (CONDEMNATION AND RIGHTS-OF-WAY).
Colo Rev Stat Ann secs 38-2-101 thru 38-2-103 (1973).

The state of Colorado has enacted specific grants of power. The power of eminent domain is granted to any corporation to acquire property, rights of way, or easements as needed to construct facilities associated with transportation, public utilities, and water conveyance and storage. Any ditch, reservoir, or pipeline company may acquire by condemnation the right to use unappropriated water. The authority to enter lands for the purpose of surveys is given to corporations constructing roads, ditches, tunnels, or railroads. The power of eminent domain is granted to private landowners to allow construction of a drain for surplus water across the land of another in order to reach a natural waterway. (Capehart-Florida)

RIGHTS TO WATER.
Ariz. Rev. Stat. Ann. secs 45-171 thru 45-175 (1956), as amended, (Supp. 1975).

Descriptors: *Arizona, *Water users, *Water rights, *Prior appropriation, Relative rights, Competing uses, Water allocation(Policy), Administrative agencies, Irrigation, Water conveyance, Channels, Water delivery, Water districts, Water distribution(Applied), Water law, State jurisdiction.
Identifiers: *Water rights(Non-riparian).

Use of water may be severed from land without losing priority already established unless the right is for irrigation usage. Consent of the owner and agency approval are required, however, for transfers of water rights. Transfers cannot be made between irrigation districts and transfers within such districts require district approval. Transfers cannot enlarge rights to use. Natural channels of streams may be used to transport waters, even though channel waters have been appropriated, if such transport does not diminish the use which has been appropriated. In event of dispute in water transport cases, district superintendents will decide the issue. If use of watercourses for carrying water is desired by a reservoir owner, the owner must notify the district supervisor who will insure that the water reaches its proper designation. With regard to use of water for irrigation purposes, land owners are preferred in times of scarcity according to appropriation dates. Vested rights to water use, relative priorities to use, rights judicially determined and rights to acquire property by eminent domain remain unimpaired by this statute. In addition, rights acquired under prior laws remain in effect provided the use of the rights is current. (Comer-Florida)

WATER POLLUTION.
Ariz Rev Stat ann secs 36-1851 thru 36-1870 (1974), as amended, (Supp. 1975).

Descriptors: *Arizona, *Administrative agencies, *Pollution abatement, *Water quality standards, Regulations, Water quality control, Water pollution control, Legislation, Permits, Sediments discharge, Effluents, Public health, Environmental sanitation, Planning, State jurisdiction, Administrative discussions.

Pursuant to statute, the water quality council, a subdivision of the department of Health Services, is given responsibility for water pollution control. The department is given general duties of administration of rules and regulations, administration of grants and loans, development of control and abatement policies and liason duties. The council is required to develop a comprehensive water quality program and to adopt and promulgate rules and regulation to implement the program. Standards may be adopted and altered to regulate water quality. Public hearings are required before standard adoption or amendment. In conjunction with the policy of this act, water pollution and reducing water quality below standards are prohibited and a permit is required to construct or alter any disposal system or to increase or cause increase in waste discharge. Violation charges may be administratively decided and corrective action ordered. The department shall have the power to inspect. Injunction and criminal charges are available as means of prevention of pollution. These statutory penalties are in addition to any common law remedies. (Comer-Florida)

tive relief, Licenses.

Plaintiff landowner brought suit to have defen
municipality's ordinance for licensing and re
ing sanitary landfills declared invalid. The pla
had obtained a permit from the state environ
tal protection agency authorizing him to instal
operate a sanitary landfill. Subsequently, the
nicipality enacted an ordinance requiring a
nicipal permit and compliance with municipal
dards. The plaintiff contended that the stat
vironmental protection act preempted the loc
dinance. The defendant contended that sinc
state permit required compliance with local
the ordinance was valid. The trial court dec
the ordinance invalid and the Supreme Court
linois affirmed, saying that the state environ
tal control act is intended to provide a u
statewide program, and thus preempts local
In a supplemental opinion denying rehearing
court stated that procedures available to the
agency are sufficient to set standards for loc
landfills. Strong dissenting opinions maint
that the decision vests more authority in the
cy than was intended by the legislature. The
sents felt that state and local governments s
be allowed to legislate concurrently on env
mental matters. (Capehart-Florida)

Ditch companies may be formed in the state of Wyoming by three or more persons who associate for the purpose of constructing ditches which will convey water to mines, mills, or lands. Such persons shall state in their certificate the streams from which the water is to be taken, the line of said ditches, and the use to which said water is to be applied. Ditch companies formed under this article shall have the right of way over the lines named in the certificate. The companies shall be required to keep the banks of their ditches in good condition so that water shall not escape. The companies shall be authorized to mortgage or execute deeds of trust to secure money for the operation of their water works or ditches. Provisions are also set forth for flume companies. IRRIGATION AND WATER RIGHTS.
Wyo Const art 8 secs, 1 thru 5.

Descriptors: *Wyoming, *Water rights, *Water distribution(Applied), *Administrative agencies, Legislation, Administration, Water management(Applied), Bodies of water, Lakes, Streams, Natural streams, Springs, State governments, Jurisdiction, Prior appropriation, Regulation, Water allocation(Policy), Beneficial use, Preferences(Water rights), Priorities, Distribution, Diversion, Water law.

The water of all natural streams, springs, lakes or other collections of still water within the boundaries of the state of Wyoming is state property. A board of control shall be established to supervise the appropriation, distribution, and diversion of these waters. Appropriation for beneficial uses shall have priority, but no appropriation shall be denied except when it is demanded by the public interests. In addition, the governor shall appoint a state engineer to preside over the board of control, and to supervise the waters of the state. To aid in this supervision, the legislature shall divide the state into water divisions. (Cowart-Florida)

CONTROL OF WATER AND EMINENT DOMAIN.
Wyo Const art 1, sec 31 thru 32.

Descriptors: *Wyoming, *Water control, *Eminent domain, *Water allocation(Policy), Water distribution(Applied), Water supply, Water demand, Competing uses, Industries, State governments, Industrial water, Channels, Priorities, Reservoirs, Ditches, Drains, Flumes, Compensation, Diversion, Relative rights, Water management(Applied), Agriculture, Mining, Sanitary engineering.

Water is essential to industrial prosperity. Although the water supply in Wyoming is limited, it is capable of being diverted from its natural channels. The control over the water supply should therefore be in the state which shall guard equally all the interests involved. As to eminent domain, private property shall not be taken for private use without the consent of the owner, except for: private ways of necessity and reservoirs, drains, flumes, ditches on or across the lands of others for agricultural, mining, milling, domestic or sanitary purposes. Private property shall not be taken in any case without due compensation. (Cowart-Florida)

GENERAL BASIS OF WATER RIGHTS IN UTAH.
Utah Code Ann secs 73-1-1 thru 73-1-11 (1968).

Descriptors: *Water allocation(Policy), *Utah, *Water rights, *Eminent domain, *Beneficial use, Legal aspects, Appropriation, Preferences(Water rights), Prior appropriation, Public rights, Water law, Reservoirs, Dams, Canals, Ditches, Flumes, Tunnels, Pumps, Equipment, Water storage, Water conveyance, Regulation, State jurisdiction.

All waters in the state of Utah, whether above or under the ground, are the property of the public. Beneficial use shall be the basis, the measure, and the limit of all rights to the use of water in the state. When an appropriator or his successor in interest abandons the use for five years, the rights shall cease and such water shall revert to the public. Any person shall have a right of way across public, private, and corporate lands for the construction, maintenance, repair and use of all necessary reservoirs, dams, water gates, canals, ditches, flumes, tunnels, pipelines and areas for setting up pumps and pumping machinery upon payment of just compensation. The purpose of the right of way shall be to secure, store, replace or convey water for domestic, culinary, industrial and irrigation needs. The rights and duties of owners of ditches and canals are enumerated. Provisions are made for the conveyance of water rights. (Cowart-Florida)
W77-03504

FLOOD CONTROL PROJECTS AND DROUGHT EMERGENCIES.
Utah Code Ann secs 17-8-1 thru -7 (1973), as amended (Supp 1975).

Descriptors: *Eminent domain, *Utah, *Flood control, *Flow control, *Multiple purpose projects, Flood protection, Flood routing, Water distribution(Applied), Water utilization, Droughts, Legislation, Flood plains, River flow, Public health, Administration, Local governments, Federal government, Regulation, Water resources development.
Identifiers: *Flood channels.

Utah has enacted legislation empowering boards of county commissioners, to contract with the United States for the construction and maintenance of any flood control project within county jurisdiction. In Addition to being within the contracting county, the project must be designed to abate or control flood waters, or any excessive accumulation of water, for the protection of life and property. A board may further contract and pay expenses to acquire easements and relocate public roads or bridges when replacement is necessitated by any flood project construction. In addition, the state engineer shall distribute the waters and operate the completed project. County boards are also empowered to authorize the clearing, improving, and fencing of natural channels, the construction of new channels, and to enforce anti-pollution laws within their respective counties. A final provision concerns the protection of flood channels and flood plains. (Lauer-Florida)

WATER, LIGHTING AND SEWERS.
Utah Code Ann secs 10-7-4, 10-7-12 thru -14.1 (1973).

Descriptors: *Utah, *Water supply, *Cities, *Water rights, *Public health, Water users, Water requirements, Water purification, Consturction, Water pollution, Treatment facilities, Water treatment, Municipalities, State governments, Water storage, Public rights, Legislation, Condemnation.

Utah has enacted legislation providing that any city or town may acquire, purchase or lease any water, waterworks system, water supply or property connected therewith. The cities or towns

may also bring condemnation proceedings to acquire the above. The resident taxpayers have a right to protest the acquisition of property and a special election is to be held to resolve the protest issue. The cities and towns have also been granted several miscellaneous rights and powers, including the power to limit use of water for any purpose other than domestic in the event of scarcity of water, and the right to enter upon any premises furnished with water by such city or town. It is the public policy of Utah to grant the privilege to municipalities to raise funds to improve health standards by providing facilities for the purification of drinking water and the treatment of raw sewage. HEAD GATES; POWERS OF STATE ENGINEER.
Utah Code Ann secs 73-5-4 and 73-5-9 (1968).

Descriptors: *Utah, *Water measurement, *Diversion, *Mechanical control, Equipment, Reservoirs, Priorities, Ditches, Regulation, Water allocation(Policy), Water utilization, Flumes, Weirs, Prior appropriations, Water control, Legislation, Construction, Consumptive use, Water distribution(Applied).
Identifiers: *Headgates.

Utah has enacted legislation providing that every person using water in the state shall construct or install and maintain a headgate or other measuring device at each point where water is diverted or turned out for the purpose of regulating and measuring the quantity of water used. These measuring devices must be approved, locked, and kept set by the state engineer. Flumes or other measuring devices may be required at points along ditches to determine the amount of water to be diverted from a stream to the ditch. Owners of reservoirs may also be required to construct and maintain a measuring device above the reservoir on each stream or source of supply discharging into the reservoir in order to determine the amount of water to which prior appropriators are entitled. The state engineer may require the construction of measuring devices to prevent waste, loss, pollution or contamination of water above or below ground. The owner shall incur the expense of complying with any requirement made by the state engineer. If after notice, the owner has not carried out the requirement, the state engineer may forbid the use of such water. (Lauer-Florida)

VILLAGE OF LOMBARD V STATE POLLUTION CONTROL BOARD (POLLUTION CONTROL BOARD WITHOUT AUTHORITY TO IMPOSE REGIONALIZATION UPON LOCAL GOVERNMENTAL BODIES).
346 NE2d 196-202 (Ill App Ct 1976). 7 p.

Descriptors: *Illinois, *Local governments, *Legal review, *Water pollution control, *Administrative agencies, Environmental control, Waste water disposal, Waste water treatment, Regional development, Regions, State governments, State jurisdiction, Legal aspects, Water pollution.

Plaintiff village sought to restrain defendant Pollution Control Board from establishing a county-wide wastewater program. The plaintiff objected to its required inclusion, and claimed that the Board did not have proper authority under Illinois law. The Board asserted that it had broad power to order county-wide regionalization that included the Village of Lombard. The Appellate Court of Illinois held that in the absence of any specific authority, the Board did not have the power to im pose wastewater regionalization on municipalitie sanitary districts, or other local, government bodies without their consent. GLASSMAN V. WELDIN FARMS, INC. (NO RIGHT IN UPPER LAND OWNER TO ARTIFICIALLY INCREASE THE NATURAL DRAINAGE OF SURFACE WATER TO INCREASE FLOODING ON LAND OF LOWER PROPERTY).
359 A2d 669-81 (Del Ct Ch 1976). 13 p.

Descriptors: *Delaware, *Surface drainage, *Surface waters, *Floods, Judicial decisions, Legal aspects, Rain, Rain water, Water injury, Drainage water, Water law, Water rights, Streams, Competing uses, Riparian rights, Reasonable use, Overflow, Water levels, Banks, Flood damage.

Plaintiffs, lower property owners, brought an action to enjoin defendant, upper property owner, from draining increased amounts of surface water into a small creek which passes through the plaintiffs' property. The county government and the State Department of Highways were joined as defendants to the extent they may be necessary to the granting of complete injunctive relief. Plaintiffs argued that under the law of Delaware an upper landowner may not artificially increase the flow of surface waters upon a lower landowner above the natural level, no matter how minimal the increase may be. Defendant, upper landowner, argued that the test under Delaware law is that of reasonable use, and that in the absence of evidence of substantial injury, the lower landowner has no standing to object to a minimal increase caused by the upper owner. The Court of Chancery granted injunctive relief to the plaintiffs holding that where intermittent heavy rainfall causes a natural waterway to overflow its banks, an upper landowner may not artificially increase drainage into that waterway in such a manner as to enlarge the area of flooding on the property of the lower owner, regardless of how insubstantial the increase may be. (Cowart-Florida)

Identifiers: Mine hydrology.

Plaintiff, Commonwealth of Pennsylvania, brought an action in equity to require the owner of a closed mine to treat acid mine drainage which was discharging from the mine. Defendant mine owner advanced a number of constitutional arguments, including one that an order abating the discharge as a public nuisance would be an unconstitutional taking of property without just compensation. The Supreme Court of Pennsylvania had found that there was a basis upon which the Commonwealth could be granted relief, and then remanded to the Commonwealth Court for determination of the issue of whether relief should be granted. That court held that the defendant mine owner did not qualify as exempt from the imposition of relief in abatement of a public nuisance for want of conduct or activity by it bearing upon the forces and conditions producing the public nuisance. The court therefore enjoined the defendant from causing or permitting the discharge of untreated acid mine water drainage. (Cowart-Florida)

CACHE LA POUDRE WATER USERS ASSOCIATION V GLACIER VIEW MEADOWS (APPROPRIATION OF WATER IN PLAN OF AUGMENTATION).
550 P2d 288-96 (Colo 1976). 9 p.

Descriptors: *Diversion, *Appropriation, *Colorado, *Consumptive use, *Wells, Well permits, Water users, Competing uses, Water utilization, Rivers, Water supply, Water resources, Reservoirs, Water management(Applied), Water rights, Administrative agencies, Diversion losses, Diversion loss returns, Water loss, Preferences(Water rights), Riparian rights.

Appellee, a developer of residential lots in the mountains, sought approval from the water court of two plans of augmentation. The plans would provide future owners of presently unimproved lots with domestic water from wells to be drilled in the future. After the augmentation plans were approved, appellants, a ditch and reservoir company and a non-profit protective association, appealed. The appellants contended that the river in question was overappropriated and that authority for the plan could not be completely predicated upon the exempt status of many of the wells. The Supreme Court of Colorado accepted these two objections, but nevertheless affirmed with some modifications. The plans were valid so long as the diversion of the water did not injure holders of vested rights; furthermore, all the wells involved in the plan were required to be treated as if they were nonexempt. The cause was, therefore, remanded with directions to modify the water court's findings. (Cowart-Florida)

TALLEY V CARLEY (PRIORITIES TO WATER IN 1963 AMENDMENT TO 82 OKLAHOMA STATUTES ANNOTATED SECTION 1-A).
551 P2d 248-52 (Okla 1976). 5p.

Descriptors: *Oklahoma, *Priorities, *Beneficial use, *Consumptive use, Appropriation, *Irrigation water, Preferences(Water rights), Legal aspects, Streams, Constitutional law, Water law, Legislation, Legal review, Competing uses, Hydrography, Surveys, Riparian rights, Relative rights, Administrative agencies.

Landowners sought to set aside the finding of the District Court that the Water Resources Board's final order of priorities to water from a creek was binding upon them. Appellants' land was upstream approximately one mile north of the land owned by appellees. Both parties asserted beneficial use of water from the creek prior to 1963. The pre-1963 law defining water rights required that a hydrographic survey was necessary to establish rights and priorities. The Supreme Court of Oklahoma held that the 1963 amendments provided that priorities could be determined based upon beneficial use prior to the effective data of the Act, and that priority dated from the initiation of the beneficial use. Therefore, appellants would have been able to establish their priorities under the new schedule, even though a hydrographic survey was never accomplished. The court found that the Water Resources Board failed to give meaningful notice to appellants, so their determination of appellants' priority rights was a nullity. In order to determine appellants' priority, another hearing before the Board was ordered. (Cowart-Florida)

UNIONS FIGHT A JONES ACT WAIVER.
Business Week, No 2370, p. 44, March 3, 1975. 1 p, 1 photo.

Descriptors: *Oil industry, *Oceans, *Water pollution, *Ships, *Legislation, *United States, Federal government, Legal aspects, Transportation, Natural gas, Oil, Alaska, Massachusetts, Access routes, Distribution, Distribution systems.
Identifiers: *Jones Act, *Unions, *Waivers, *Gas reserves.

The Jones Act, passed in 1920, stipulates that shipping between domestic U. S. ports, including those of Alaska, Hawaii, and Puerto Rico, be carried exclusively in U. S. flagships built in U. S. shipyards and manned by American seamen. Waivers for any of these requirements may be allowed only in the interest of national defense. Currently, New England LNG Inc. wants to use a Liberian ship to carry natural gas supplies from Alaska to Boston. The company says that no ships are available and that gas reserves are needed. The maritime industry, led by the Seafarers International Union, calls it an attempt to dodge shipping taxes and evade the law. A decision on the matter will be forthcoming from the Secretary of the Treasury. (Frank-Florida)

A SWEEPING SEA LAW IN 1976.
Business Week, No 2424, p 167-68, March 22, 1976. 2 p, 1 tab.

Descriptors: *Continental shelf, *Law of the sea, *United Nations, *Fishing, *Environmental effects, International law, Navigation, Water law, Oceans, Mining, Mining engineering, Manganese, Nickel, Copper, Water pollution, Oil pollution, Legal aspects, Foreign countries.
Identifiers: *Coastal waters, *Water rights(Non-riparian).

The Third United Nations Law of the Sea Conference will attempt to negotiate specific treaty provisions pertaining to the governing of the oceans. As to deep sea mining, the Third World bloc of nations wants an International Sea-bed Authority with broad powers to limit the amount of materials to be extracted, to set prices, and to allocate mining sectors. Besides conserving natural resources, these broad powers would protect the commodity export markets of the developing nations. The developed countries, however, who possess the technology to conduct large-scale deep sea mining ventures, want an International Authority limited to issuing licenses and assuming royalty payments to other countries. Another potentially troublesome issue involves the straits. As territorial waters are expanded to 12 miles from 3, certain straits might be closed off, as they a not 24 miles wide. Among these are the straits Gibraltar and Dover, as well as the Malac Straits. If these straits are closed to navigation, shipping prices would significantly increase. Pol tion is also becoming a point of contention. So countries want the flag state--the one in which t ship is registered--to be responsible for the forcement of pollution rules. This would prev the United States from seizing a Russian ship polluting te waters around Alaska. Fishing rig were thought to be far from settled, but individ countries have signed treaties with each other t set license fees for fishing rights in different are Hopefully, this spirit of negotiation will result an international fishing treaty. THE COST OF COASTAL ZONING.
Business Week, No. 2430, p 71, 74, May 3, 197 p, 1 photo.

Descriptors: *California, *Legislation, *Zon *Regulation, *Shore protection, Shores, C demnation, Condemnation value, Beach Seashores, Coastal engineering, Coastal st tures, Marsh management, State governme Regional development, Property values, L aspects.
Identifiers: *Coastal zone management, Prop tion 20(Calif).

California has led the nation in protection of coastline, but it is being challenged at the pre time to keep up that standard. Under Californ Proposition 20, voters have set up a series of t porary state and regional coastal commission lay the groundwork for an eventual statev coastal zoning plan. The commissions ultima produced a bill calling for state acquisition of spoiled natural areas, concentration of co growth in already developed areas, maximum cess to beaches, and stringent controls ove development in an area running from 1,000 y to as much as 5 miles inland. Businessmen fighting the legislation, complaining that buil costs will skyrocket and that many jobs wi lost. In a related development concerning in zoning a United States District Court in Ar Ltd. Partnership v. City of Palo Alto ruled tha city's open-space zoning regulations resulted i verse condemnation of 515 acres of r foothills. The city preferred not to buy the but merely to zone it so as to preclude undesi development. A second trial to assess damag forthcoming, with the amount expected to the millions -- the difference in property value fore and after the re-zoning. If the holding is mately upheld, it could have a significant im on stringent coastal area zoning. (Frank-Florid

THE LEGAL FRAMEWORK FOR PUBLIC TICIPATION IN CANADIAN WA MANAGEMENT,
Canada Centre for Inland Waters, Burlin (Ontario).
C. G. Morley.
Social Science Series No. 14, 1975. 74 p. 71 ref

Descriptors: *Canada, *Decision making, *P rights, *Legal aspects, Resources develop Legislation, Common law, Social participatio
Identifiers: *Resource management, *Public ticipation.

The legal basis for public participation in res management was examined by focusing on vant federal and provincial legislation as w common law cases. It was found that: (1 Canadian legal system does not guarante

U. OF I. URBANA-CHAMP

en a right to participate in resource develop-
t and management decisions, (2) under com-
law, a citizen can be heard by the decision
ing body and can also make claims for com-
ation, (3) the system is reactive, since the
tiff must prove damages and legal redress can
occur after the fact, (4) public hearings,
gh allowing the presentation of the public's
s, are structured, one-way forms of communi-
n which are inadequate to assert environmen-
ghts, (5) the convening of a public hearing is a
etionary power given to an official under
ral and provincial legislation, (6) the exercise
is discretion together with the lack of formal
nels to express discontent could intensify the
ical controversy of issues, and (7) public
ings allow the public very little access to the
ation of environmental policy. Based on these
ngs, a number of recommendations are made,
entral one being that effective participation in
ion making must be established by legislation
h makes suuch participation a legal right.

FORNIA WATER PROJECT: LAW AND
ICS,
rnia Univ., Berkeley. Dept. of Economics.
aylor.

Ecology Law Quarterly, Vol 5, No 1, p 1-52 (1975). 52 p.

Descriptors: *California, *Land reclamation, *Acreage, *Federal Reclamation Law, *Land tenure, *Federal project policy, Arid lands, Projects, Water resources development, Water supply development, Political aspects, Farm units, Water policy, Cost allocation, Cost repayment, Water supply, Water management(Applied), Federal jurisdiction, State jurisdiction, Federal-state water rights conflicts, Legislation, Administrative decisions, Judicial decision.

The California Water Project of 1960 is a classic illustration of large landowners circumventing federal water policy. Although water availability in the arid California farmlands is a major problem, land ownership in the region is concentrated into large holdings and federal reclamation law has excess acreage requirements with 160 acre limits. When federal funding was first authorized in the region during the depression, opposition was small because of resident desperation. Since then a thirty year battle has ensued. The first means of circumvention attempted was state project funding. Economics mitigated otherwise, however, and federal funds were required. Floor battles in the House and Senate followed in attempts to get federal funds with an exemption from the acreage limit. The exemption was defeated but an additional provision for further approval left doors open. The Solicitor of the Interior, in interpreting the Congressional result, determined that Congress intended exemption; thus, when the federal-state contract was sent to Congress for approval it was approved without the acreage limitation. Although California courts had held the limit applicable to the project, when a Federal court decision was sought the large landowners won. (Comer-Florida)

FREEDOM OF BEACH,
R. Bongartz.
N. Y. Times Magazine, p 12-13,27,30-32, July 13, 1975. 6 p, 4 photo.

Descriptors: *Beaches, *Access routes, *Right-of-way, *High water mark, *Law enforcement, Transportation, California, Oregon, Connecticut, Public access, Public rights, Public benefits, Legal aspects, Trespass, Easements, Piers.
Identifiers: *Coastal waters, *Public beach access.

Towns and villages have been trying to regulate the use of shoreline swimming areas for a long time. To protest beach restrictions and 'private' beaches, activists like Ned Coll once a weekend during the summer months, bus black children and their parents from Hartford, Connecticut, into private beach areas around the state. Coll's plan is to emphasize the need for open beaches accessible to all. While in the west, notably in California and Oregon, there are laws protecting beach access for the public, the east lags far behind. A National Open Beaches Bill has been introduced in Congress, but its passage seems uncertain. It would grant to the public the absolute right to use all beaches not owned by the government or set aside for other purposes. The Supreme Court recognizes the mean high tide line as dividing public from private areas. Ned Coll has been leading his charges over beach walls in an attempt to publicize his philosophy that the entire shore of the country should be open to the public. (Frank-Florida)

A CLOSER LOOK AT SOME ISSUES FOR GENERA-OCEANS POLICY, MARINE ENVIRONMENT, AND FISHERIES,
Columbia Univ., New York. School of Law.
L. H. Henkin.
Columbia Journal of Transnational Law, Vol 14, No 1, p 56-79 (1975). 24 p.

Descriptors: *Continental shelf, *Law of the sea, *Treaties, *International law, *Oceans, Navigation, Legal aspects, Fisheries, Commercial fishing, Environmental effects, Environmental control, International waters, Foreign waters, Seas, Bodies of water, United Nations, Governments, Foreign government, United States.
Identifiers: *Coastal waters, *Law of the Seas Conference, Coastal zone management, Territorial seas(Jurisdiction).

In all probability, any law of the sea treaty will extend the territorial sea to twelve miles and provide coastal states with 200 mile economic zones. The impact of such a zone on land-locked nations and those with short coastlines will be grave since virtually all ocean resources will fall within some coastal nation's economic zone. Alternative methods of oceanic subdivision, such as the 'straight baseline' approach, will only lead to greater conflicts. While the present juridictional framework allows for exploitation of fisheries and other resources and fails to provide environmental standards for the seas, the economic zone approach offers no significant improvements. Agreements on resource utilization are difficult to reach as each nation ideally wants its own zone exclusively and the free use of the zones of others as well. Similarly, pollution standards also create international controversy. Smaller nations concerned with development oppose environmental obstacles to their growth while larger nations reject a double standard approach. Yet another source of conflict in the proposed treaty is the method of dispute settlement. Ad hoc arbitration lacks uniformity and the International Court of Justice lacks expertise. Therefore, although it may create additional expense and bureaucracy, the establishment of a Law of the Sea Tribunal is preferred. (Moorhouse-Florida)

Identifiers: *Coastal zone management, *Economic zones.

A showdown is imminent between the United States Congress and the nations of the world who are trying to negotiate a new Law of the Sea at the Third United Nations Conference. Preliminary

votes on the Studd and Magnuson bills in the House and Senate, respectively, indicate that Congress is willing to unilaterally declare a 200-mile economic and fishing territorial limit in United States' waters. Henry Kissinger and others familiar with the international negotiations have pleaded with Congress to delay action, saying that the Law of the Sea Conference and the treaty it could produce are the most important international projects in centuries. Proponents of the bill, however, want protection for the fishing industry, claiming that foreign vessels are taking too much of the continental shelf fish resources. Despite the validity of this contention, it is hoped that cooler heads will prevail in Congress. Most likely, a 200-mile limit will be the result of the Conference, but unilateral American action could seriously impair future international efforts to solve world-wide problems. Also, according to several international law experts, such an action would be in contravention of several treaties to which the United States is now a signatory. (Frank-Florida)

Northwest Mariculture Laws - Papers and Presentations from a symposium held at the Law Center, University of Oregon, Eugene, Oregon, June 7, 1974; Available from Sea Grant Communications, Oregon State Univ., Corvallis, Or. 97331, (1975). 31 p.

Descriptors: *Marine animals, *Marine fish, *Commercial fishing, *Fish farming, *Aquiculture, Aquatic productivity, Fish, Shellfish, Fish hatcheries, Fish management, Fishery, Oysters, Commercial shellfish, Shellfish farming, Legal aspects, Pacific Coast Region, Salmon, Aquatic life, Law of the Sea, International law.
Identifiers: *Mariculture, *Marine aquaculture.

Mariculture or salt water 'fish farming' has been practiced in Northwest fisheries for many years. Recent legislation in Oregon, however, has made new Pacific species available to this growing field of commercial enterprise. The proceedings of a recent symposium on mariculture laws examined the legal implications of establishing and operating a mariculture business, the relationship of Oregon shellfish (specifically oysters) to mariculture, mariculture and the international law of the sea, and the legal aspects of marine aquaculture as compared with those of ownership and use of land for agriculture. The new era of aquaculture was explored, and divergent uses of marine waters analyzed. (Cowart-Florida)

WATER RIGHTS,
Wisconsin Univ., Madison.
J. B. MacDonald, and J. H. Beuscher.
(2nd ed. 1973). 659 p, 6 map, 24 photo, 6 illus.

Descriptors: *Water rights, *Riparian rights, *Competing uses, *Legislation, *Legal aspects, Federal-states water rights conflicts, Equitable apportionment, Water law, Federal government, State governments, Local governments, Governmental interrelations, Administrative agency, Abatement, Water pollution control, Regulation, Zoning, Land use, Regions, Water quality control, Penalty(Legal), Judicial decisions, Law enforcement, Legal review, Pollution taxes(Charges).
Identifiers: Licenses, Administrative regulations, Water rights(Non-riparian).

This collection of materials focuses on water problem typical of the humid east. Its expanded format is due to the increased volume of legislation and litigation that has taken place nationwide. Results of research undertaken at the University of Wisconsin for the past twenty-five years are included. In addition to traditional materials on diffused surface waters, groundwater and riparian rights laws, means of firming up riparian rights are also stressed. Conflicts between riparian private rights and claims of non-riparian members of the public, particularly concerning recreational uses of water and maintenance of water quality, are given great attention. Shoreline zoning as a means of preserving water quality is considered. Attention is given to federal-state and state-state water law problems. The limitations imposed on private water use by both the state and federal governments are investigated in detail. Various aspects of water pollution abatement are reviewed including: the role of the courts; specialized administrative agencies; restrictive use of shorelines; sanctions, incentives, and charges. Scholarly writings, technical information, and court decisions are included to substantiate all issues presented. (Moorhouse-Florida)

FLOOD DISASTER PROTECTION ACT 1973,
Central and Southern Florida Flood Contro trict, West Palm Beach.
D. O. Morgan.
In Depth Report, Vol. 2, No. 5, p. 1-8 (Nov. 1974). 8 p, 1 photo, 3 chart.

Descriptors: *Flood protection, *Flood co *Flood damage, *Flood plain insurance, Le tion, Legal aspects, Flood profiles, Insu Compensation, Costs, Damages, Prote Risks, Disasters, Flood data, Flood plains, F water, Water injury, Flood forecasting, frequency, Flood plain zoning, Flooding.

As a result of a flood insurance feasibility undertaken by the Secretary of Housing Urban Development in 1966, it was deter that a national flood insurance program was ble, and could provide subsidized premium for property in high risk areas. Subsequen 1968 Congress passed the National Floo

nce Act. Improving on the shortcomings of the
Act, the Flood Disaster Protection Act of
expands the limits of insurance coverage, and
nds the emergency program for two more
s. Further, it creates incentive for flood-prone
munities to enter the program, requires in-
nce on all federal or federally-assisted financ-
of buildings in flood-prone areas, and
blishes explicit procedures for communities
ing to appeal HUD's flood elevation deter-
ations. With these measures the National
d Insurance Program will be able to provide
certainty of financial protection for anyone
decides that it may be necessary to build in
d-prone areas in the future. (Cowart-Florida)

GULF OF ALASKA STUDY OF MESOSCALE OCEANOGRAPHIC PROCESSES (GAS-MOP),
National Oceanic and Atmospheric Administration, Seattle, Wash. Pacific Marine Environmental Lab.
S. P. Hayes, and J. D. Schumacher.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Year Ending March 1976, Vol 11. Physical Oceanography and Meteorology, p 75-106, April 1976. 11 fig, 1 tab, 15 ref. R7120846 and R7120847.

Descriptors: *Alaska, *Circulation, *Ocean circulation, *Ocean currents, *Oil pollution, *Oil spills, *Resources development, *Baseline studies, *Water pollution, *Environmental effects, Meteorology, Seasonal.
Identifiers: *Outer Continental Shelf, *Physical oceanography, *Petroleum resources, Oil exploration, Oil development, Mesoscale processes, Gulf of Alaska.

The objective of this research is to describe the mesoscale oceanic circulation on the continental shelf in the Gulf of Alaska in order to characterize the intermediate scale advective and diffusive processes. These processes are inherently important to the assessment of potential pollution problems due to OCS petroleum development. To date, data collected, processed and analyzed from the Gulf of Alaska indicate the following preliminary conclusions: The mean flow is high (of order 25 cm/sec) and directed to the west generally following the local isobaths. There are considerable variations in the mean flow and in the fluctuations. The flow near Kodiak Island is larger than that measured at other shelf break locations. During winter storm-induced velocity changes are of the same order as the mean flow. These appear to be mainly barotropic and hence linearly related to the sea surface slope. During spring the velocity field is more complex. The fluctuations in the velocity do not correlate simply with the bottom pressure. It appears that nonlocal forcing may be important. The seasonal change in the density stratification is relfected in the coherence of the currents. During winter high coherence from 20 m to 100 m is observed. In the summer the coherence is lower. HO ENVIRONMENTAL OVERVIEW,
sulting Engineers, Inc., Boise, Idaho.
Montgomery.
ember 1975. 261 p. 106 fig., 240 ref, append.

criptors: *Census, *Idaho, Data collections, er resources, Land resources, Environmental cts, Air pollution, Water pollution, Water ity, Wildlife, Fish, Land use, Planning.
tifiers: Panhandle basin(Id), Clearwater-Sal- basin(Id), Southwest basin(Id), Upper Snake n(Id), Bear River basin(Id).

nventory of available data and evaluations of ing and potential environmental conditions is ided for use by state agencies involved in ning, administration, resource management, research. The inventory is divided into five r sections each of which covers one of the hydrologic basins in the state, the Panhandle, rwater-Salmon, Southwest Idaho, Upper e, and Bear River. Air quality, aquatic at, land use concerns such as flood hazard s, critical soil and slope, geothermal areas, quake zones, deteriorated range or forest itions, mining impact areas, second home ivisions, accelerated change, and solid waste sal sites, water quality, wildlife, and out-ding areas such as rare plants, wildlands, s and lakes, and scenic, natural or recrea-l areas within each of these five basins are narized in a catalog style presentation cross-renced to area maps. A bibliography broken by hydrologic basins is also included, as are or organizations and related programs.

ERIMENTAL ECOLOGY OF SELECTED TEBRATE SPECIES,
burgh Univ., Pa.
Hartman.
lable from the National Technical Informa-Service, Springfield, VA 22161 as COO-3426-Price codes: A03 in paper copy, A01 in ofiche. Progress Report COO-3426-13, July 31 p, 367 ref. AT(11-1)3426.

criptors: *Bibliographies, *Forests, *Small als(Mammals), *Trees, Coniferous trees, duous trees, Shrubs, Wildlife, Rodents, Deer, s.
tifiers: *Mast production, *Seeds, Pine cones, ns.

The following papers have been prepared under contract COO-3426: 'The effects of tow-clipping on the survivorship of free-ranging eastern chipmunks' by D.L. Graybill, et al.; 'Seasonal and annual variations in the quantities of nitrogen, potassium phosphorus, magnesium, calcium, and manganese reaching the forest floow as mast in Pennsylvania and Vermont forests' by D.L. Graybill, et al.; 'The effects of season, sex, and cage size on the ingestion, respiration, and body weight of captive eastern chipmunks' by D.L. Graybill; 'Factors affecting home range, and range length of the eastern chipmunk, Tamias striatus, in northwestern Pennsylvania' by G.G. West; 'Effect of sublethal exposure to gamma radiation on range parameters in the eastern chipmunk, Tamias striatus' by D.P. Snyder, et al.; 'Bibliography of Mast Production' by D.L. Graybill and D.P. Snyder. The latter contains 362 listings, updated to December 1974, and represents research conducted on seed production in forest ecosystems. Although the emphasis is on United States' conifers, secondary emphasis is on oaks, followed by deciduous trees, fruit trees and shrubs. Research from Scandinavia, the United Kingdom, Canada, New Zealand, Europe, Japan, India, USSR, Puerto Rico, Mozambique and Turkey is represented. The nutritive properties of seeds for mammals and birds, seed production, seed crops, management and collection procedures are discussed, as are commercial utilization of nutshells and fruit pits, climatic effects and other aspects of mast production. ENVIRONMENTAL STATUS OF THE LAKE MICHIGAN REGION. VOL. 17. INLAND FISHES OF THE LAKE MICHIGAN DRAINAGE BASIN,
Argonne National Lab., Ill.
G. C. Becker.
Report No. ANL/ES-40, Vol. 17, September 1976. 237 p. 111 fig., 1 tab., 295 ref. ERDA W-31-109-Eng-38.

Descriptors: *Watersheds(Basins), *Lake Michigan, *Fishes, *Varieties, *Distribution, Habitats, Spawning, Limiting factors, Value, Aethetics, Bibliographies, Thermal pollution, Water pollution effects, Michigan, Wisconsin, Indiana, Illinois, Streams, Lakes, Sport fish, Commercial fish.

The distribution of fishes, by family and species, in the streams and lakes of Michigan, Wisconsin, Indiana and Illinois is presented. One-hundred thirty-eight species are found within the Lake Michigan Basin and each species range and abundance, its habitat preferences, spawning requirements (temperature, substrate, water velocity, hatching temperatures, developmental period), feeding habits, and adult size, and temperature, oxygen and pH tolerance are indicated. Information is given as to their commercial value, palatability, demand as sport fish, bait, prey species and/or pet, supplemented by comments on their status, i.e., exterminated, threatened, or prolific, and management procedures, particularly where the status is rare or threatened. Species erroneously reported in this basin and those which did not survive transplantation, did not propagate, or otherwise establish successful populations are briefly treated in a separate section. A bibliography of publications dealing with the effects of thermal and chemical pollutants on fishes as well as species distribution maps are given. (Auen-Wisconsin)

ENVIRONMENTAL CONCERN AS A FACTOR IN COASTAL ZONE DEVELOPMENT: A STUDY OF LOUISIANA CITIZENS,
Louisiana State Univ., Baton Rouge. Dept. of Rural Sociology Research.
T. K. Pinhey, and K. W. Paterson.
Coastal Zone Management Journal, Vol 2, No 3, p 297-310 (1976). 14 p, 5 tab, 17 ref.

Descriptors: *Coastal plains, *Psychological aspects, *Louisiana, *Surveys, *Environmental effects, Environment, Coasts, Shores, Shore protection, Attitudes, Decision making, Social aspects, Motivation, Social impact, Social needs, Social participation, Investigations, Evaluation, Data collections.
Identifiers: *Coastal zone management, *Coastal Zone Management Act of 1972(CZMA).

State agencies in charge of implementing the Coastal Zone Management Act of 1972 have perforce become increasingly interested in the views and attitudes of those subject to their rulings. In Louisiana, a statewide sample survey was made which was designed to measure public knowledge of and attitudes toward environmental issues. It was designed to add to previous literature on the subject, which substantiated the theory that the environmental movement is essentially an upper middle class social phenomenon associated with high education, high income, and urban residence. The survey contained 32 questions, used 20 interviewers, and was done with a sample of 926 residents of the state. The results showed that: (1) most people were unaware of current planning efforts; (2) most people felt that the coastal natural environment was valuable and worth protecting; (3) most people felt that the environment of the coastal zone would improve in the future; and (4) blacks were more concerned with natural disasters, while whites worried more about environmental problems. ELECTRONIC SENSOR FOR LOW-TO-MEDIUM WINDSPEEDS,
Agricultural Research Service, Yakima, Wash.
P. A. Boving.
Agricultural Engineering, Vol. 57, No. 3, p 20, March 1976. 2 fig, 2 ref.

Descriptors: *Instrumentation, *Winds, *Anemometers, Agriculture, Micrometeorology, Velocity, Flow measurement, Bridges(Electric), Weather, Weather data, Sprays.
Identifiers: *Thermistors, *Windspeed sensors, Cup anemometer, Bridge circuit.

A low speed anemometer which uses thermistors as the sensor and in the measuring circuit was described. The bridge circuit operates on 8 volts with an input voltage from 10.5 to 24 volts d-c. The output of the bridge was designed to match the input requirements of an analog recorder also used to record other meteorological signals. The output was found to be accurate to + or - 0.1 mph from 0 to 12 mph. (Jones-ISWS)

RETRANSMISSION OF HYDROMETRIC DATA IN CANADA,
Department of the Environment, Ottawa (Ontario). Applied Hydrology Div.
R. A. Halliday.
Type I Report, SR 28190, October 1975. 9 p, 1 fig, 1 tab.

Descriptors: *Hydrologic data, *Flood forecasting, *Canada, Inflow, *Data collections, Meteorological data, Satellites(Artificial), Water levels, Projects, *Data transmission, Remote sensing.
Identifiers: *Hydrometric data, *Retransmission, Data collection platforms, Test site, Landsat, Solar panel.

Thirteen Data Collection Platforms, nine GE and four Ball Brothers Research Corporation (BBRC) Convertible Data Collection Platforms model CDCP-100 (CDCP), transmitted hydrometric and meteorological data from remote hydrometric stations within Canada's mainland to Landsat 2. The system met requirements, and the suitability of retransmission by satellite had been demonstrated. Several CDCPs had been checked out at a site on the Bow River below Carseland Dam near Calgary, Alberta. Experiments using one BBRC CDCP were made in the GOES mode, but they were unsuccessful. On the basis of these results, it was apparent that retransmission by satellite is an excellent method of obtaining data from isolated areas. In vast regions of Canada, it is the only way to obtain data on a near real time basis. (Roberts-ISWS)

Alaska Univ., College. Geophysical Inst.
A. E. Belon.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Year Ending March 1976, Vol 14. Ice, p 409-456, April 1976. 14 fig, 2 tab, 6 ref, append. 03-5-022-55.

Descriptors: *Alaska, *Sea ice, *Remote sensing, *Sediment transport, *Baseline studies, *Resources development, *Water pollution, *Oil spills, *Oil pollution, Data collections, Navigation.
Identifiers: *Outer Continental Shelf, Petroleum resources, Oil exploration, Oil development, *Fast ice, Suspended sediments.

The primary objective of the project was to assemble available remote-sensing data of the Alaskan outer continental shelf and to assist OCS investigators in the analysis and interpretation of these data to provide a comprehensive assessment of the development and decay of fast ice, sediment plumes and offshore suspended sediment patterns along the Alaskan coast from Yakutat to Demarcation Bay. The acquisition of remote-sensing data, especially satellite data, has proved to be a cost-effective method of monitoring the environment on a synoptic scale. The morphology and dynamics of sea-ice which are relevant to navigation and construction of offshore structures, the patterns of sediment transport and sea-surface circulation which will aid to forecast trajectories of potential oil spills and impact on fisheries, the nature of ecosystems in the near-shore regions which can be changed by human activity, are among the critical development-related environmental parameters which can be studied, in conjunction with appropriate field measurements, and eventually routinely monitored by remote-sensing. The demonstration projects have shown that LANDSAT data can be used effectively for developing models of suspended transport and therefore for preparing contingency plans based on the movement of oil spills in Alaskan coastal waters, for planning navigation routes and offshore drilling structures in coastal areas where sea-ice is prevalent, and for assessing the potential physical and biological impact of developmental activities on the coastal zone. TE AND COUNTY AREA TABULATIONS THE COLORADO RIVER BASIN,
ic Health Service, Denver, Colo. Div. of r Supply and Pollution Control.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-245 734, Price codes: A02 in paper copy, A01 in microfiche. January 1962. 21 p, 1 map, 5 tab.

Descriptors: *Drainage area, *Watersheds(Basins), *Colorado River Basin, *Colorado River, Drainage, River basins, Rivers, Interstate rivers, Mapping, *Data collections.
Identifiers: States(Tabulations), Counties(Tabulations).

This report provided drainage area determinations which have been adopted as standard basic data for use in the Colorado River Basin Water Quality Control Project. A check of available data of this type prepared by various public and private agencies revealed slight variations among the various sources. The data contained in this report were developed, therefore, to avoid confusion that might arise if a standard set of these data were not specified for use in this project. Measurements of the drainage area were obtained with a planimeter on the most recent maps available. For the most part, the national topographic series of quadrangle maps of the United States Geological Survey, on a scale of 1:62,500, were used for this purpose. In some instances, maps with a scale of up to 1:250,000 were the best available and were consequently used, although it is recognized that the degree of accuracy in those instances is less than would be desirable. A HISTORICAL SUMMARY OF EARTHQUAKE EPICENTERS IN AND NEAR ALASKA,
National Geophysical and Solar-Terrestrial Data Center, Boulder, Colo.
H. Meyers.

In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Year Ending March 1976, Vol 13. Geology, p 341-416, April 1976. 6 fig, 6 tab, 13 ref, 7 append. Also as NOAA Technical Memorandum EDS NGSDC-1.

Descriptors: *Alaska, *Earthquakes, *Hazards, *Resources development, *Environmental effects, *Baseline studies, Oil pollution, Water pollution, *Data collections.
Identifiers: *Outer Continental Shelf, Oil exploration, Oil development, Petroleum resources, *Gulf of Alaska, Epicenters.

This publication summarizes the Alaska earthquake data file as presently developed by the National Geophysical and Solar-Terrestrial Data Center (NGSDC). This is a growing file and additional data are being added both for current and historical earthquakes as they are prepared for machine processing. It describes data formats, sources used in developing the data file, and data limitations. Included are several tables which summarize the data in usable forms. The publication also is designed to accompany magnetic tapes, microfilm, and printouts produced from the data file. The data file contains information on earthquakes, known or suspected explosions, and other earth disturbances for the period 1786 through 1974. The file includes for each event the date, origin time, geographic location, focal depth, and magnitude when available. (Sinha-OEIS)

MEASURED AND SIMULATED GROUND-WATER LEVELS IN THE FRANKLIN AREA, SOUTHEASTERN VIRGINIA,
Geological Survey, Albany, N. Y. Water Resources Div.
O. J. Cosner.
Water-Resources Investigations 76-83 (open-file report), 1976. 5 sheets, 3 ref.

Descriptors: *Groundwater resources, *Model studies, *Aquifer characteristics, *Water levels, *Potentiometric level, Computer models, Synoptic analysis, *Maps, Evaluation, Hydrologic data, *Virginia, Coastal plains.
Identifiers: Franklin area(Va).

The Lower Cretaceous aquifer is the principal source of water in Southeastern Virginia. Synoptic water-level measurements made since 1970 have been used to verify a digital model of the aquifer. Measurements made in December 1973, August and December 1974 were used to further verify the model, using updated pumpage for those periods. The close agreement of the potentiometric maps based on measured and simulated water levels indicates that the model is simulating hydrologic conditions satisfactorily. (Woodard-USGS)

GROUND-WATER LEVELS IN NEW MEXIC 1975,
Geological Survey, Albuquerque, N. Mex. Wa Resources Div.
J. D. Hudson.
New Mexico, State Engineer Office, Santa F Basic Data Report, 1976. 128 p, 33 fig, 56 tab, 3 ref.

Descriptors: *Groundwater resourc *Observation wells, *Water level fluctuatio *Water utilization, *New Mexico, Hydrolo data, Basic data collections, Aquifers, Bibliog phies, Groundwater, Publications.

Water levels in New Mexico are measured perio cally in a network of about 1,600 observation w to record changes in ground-water storage. T areas of water-level observation are within sev of the nine major surface-water drainage basi most are in areas where ground water is used large quantities for irrigation, municipal, or ind trial purposes. Measurements tabulated w made in January, February, or March 1976 reflect water-level changes during 1975 when co pared with measurements in January or Febru 1975. Water-level chages indicate a rise in 6 ar and a decline in 21 areas of ground water-le monitoring in New Mexico during 1975. The m significant average rises occurred in the Gra Bluewater area (+0.83 ft), the Sunshine Val area (+0.38 ft) and in the Playas basin (+0.19 The largest average declines occurred in Cu County (-3.29 ft), the Carlsbad area (-2.87 ft), the Northern High Plains (-1.59 ft). Water leve when averaged for 27 areas of the State, indicat decline of 0.88 ft. No large changes in irriga acreage were noted in the State in 1975. A bibli raphy of more than 300 papers and publicati pertaining to ground water in New Mex published or released to the open file in 1975, w additions from 1886-74 is included. (Wooda USGS)

GROUND-WATER QUALITY DATA F GEORGIA,
Geological Survey, Doraville, Ga. Wa Resources Div.
R. G. Grantham, and W. R. Stokes.
Geological Survey report, 1976. 216 p, 4 fig, 4 t 13 ref. (Prepared in cooperation with the Geo Department of Natural Resources, Atla Geologic and Water Resources Division.).

Descriptors: *Groundwater resour *Groundwater availability, *Water qual *Aquifers, *Georgia, Data collections, Wa wells, Sampling, Chemical analysis.

Ground water is found in all the physiograp provinces of Georgia. The Coastal Plain of Ge gia has the most abundant supply, while remainder of the State has supplies in vary amounts depending upon subsurface rock ty Georgia ground waters generally have consis chemical quality and usually require little or chemical treatment. Because of the increased of ground water and its importance to the w being of the citizens of Georgia, the Georgia partment of Natural Resources has funded preparation of this report by the U.S. Geolog Survey. The report is a compilation of U Geological Survey ground-water-quality data lected from 1938 to 1971. The water samples h been analyzed by U.S. Geological Survey regi laboratories. The samples are from wells for wh the location, casing depth, and total depth coul verified. (Woodard-USGS)

MINIMUM UNIT STREAM POWER AND FLUVIAL HYDRAULICS,
Corps of Engineers, Chicago, Ill. North Central Div.
C. T. Yang.
Proceedings of ASCE, Vol. 102, No. HY7, Proc. 12238, July 1976, p. 919-934. 9 fig, 3 tab, 9 ref. OWRT B-075-ILL(3). 14-31-0001-3881.

Descriptors: *Hydraulics, *Open channel flow, Rivers, *Sediment transport.
Identifiers: *Fluvial hydraulics, Unit stream power.

Fluvial hydraulics is complex because the velocity, slope, depth, and channel roughness are all subject to change. The unit stream power, defined as the rate of potential energy expenditure per unit weight of water, required to transport a given sediment load is sensitive to water depth when the sediment concentration is low. The interdependence between unit stream power and water depth decreases as sediment concentration increases. A computer program is used to generate different combinations of velocity, slope, depth, and unit stream power for a given sediment load. The generated unit stream power in the lower flow regime either has a clear minimum value at a particular depth or approaches a minimum value for a given sediment load. These agreements suggest that an alluvial channel in the lower flow regime adjusts its velocity, slope, depth, and roughness in such a manner that a given sediment load can be transported with the minimum amount of unit stream power.
W77-03080

HYDRODYNAMIC FORCES ON MULTIPLE CIRCULAR CYLINDERS,
Oregon State Univ., Corvallis. Dept. of Civil Engineering.
T. Yamamoto.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 102, No. HY9, Proceedings Paper 12395, p 1193-1210, September 1976. 10 fig, 14 ref, 2 append. NOAA 04-5-158-2.

Descriptors: *Hydrodynamics, *Mathematical studies, *Flow around objects, Analysis, Equations, Vibrations, Waves(Water), Coastal structures, Earthquakes, Flow, Structures.
Identifiers: *Potential flow, *Force coefficients, Cylinders, Forces, Added mass.

The potential flow solution was determined for a number of cylinders in translational motions perpendicular to their axes and submerged in a uniform flow. The number of cylinders, their radii, and the directions of the motions were all arbitrary. The hydrodynamic forces were obtained analytically. For a simplified case of two cylinders, the general hydrodynamic forces were expressed in terms of six force coefficients which are functions of the cylinder radii and the distance between them. However, the coefficients were independent of the direction of motion of the cylinders. The added mass coefficient of a cylinder moving near a rigid boundary in a still fluid is from 2.3 to 1.0, whereas the coefficient of a stationary cylinder near a rigid circular boundary in a uniform flow varies from 5.6 to -1. The results may be useful to the earthquake-resistant design of offshore structures as well as to the wave force desugn of such structures. (Adams-ISWS)
W77-03081

CAVITATION FROM SURFACE IRREGULARITIES IN HIGH VELOCITY,
Colorado State Univ., Fort Collins.
J. W. Ball.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 102, No. HY9, Proceedings Paper No. 12435, p 1283-1297, September 1976. 27 fig, 16 ref, 1 append.

Descriptors: *Cavitation, *Prototype tests, *Hydraulic design, *Design criteria, *Boundaries(Surfaces), Flow characteristics, Hydraulic structures, Spillways, Outlet works, Photography, Construction joints, Structural behavior.
Identifiers: *Cavitation damage, High velocity flow, Cavitation index, Surface roughness.

Irregularities in flow surfaces of hydraulic structures operating at high velocities have been the source of serious damage by cavitation. The types of surfaces often encountered in construction were shown, and many examples of cavitation damage induced by irregularities were shown photographically. Charts from which critical sizes of some of the types can be determined were presented. Methods used to reduce the irregularities to acceptable tolerance were noted, and the use of aeration slots and tunnel offsets used in recent designs to eliminate cavitation damage that would otherwise occur at the irregularities was reviewed. (Adams-ISWS)

W77-03082

QUADRATIC FINITE ELEMENTS IN SHALLOW WATER PROBLEMS,
Universidade Federal do Rio Grande do Sul, Porto Alegre (Brazil).
P. W. Partridge, and C. A. Brebbia.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 102, No. HY9, Proceedings Paper 12418, p 1299-1313, September 1976. 11 fig, 8 ref, 2 append.

Descriptors: *Channels, *Coastal engineering, *Analytical techniques, *Hydrodynamics, *Estuaries, Momentum equation, Numerical analysis, Continuity equation, Tides, Computers, Finite element analysis.
Identifiers: *Implicit scheme, Shallow water equations, Forcing function.

Two quadratic finite element models of the shallow water equations were presented. One model used an explicit fourth order Runge Kutta time integration scheme; the other model used an implicit trapezoidal rule scheme. The shallow water equations comprise two momentum equations and a continuity equation. The models were applied to a rectangular channel, simulating tidal behavior of an estuary. Stability, accuracy, and influence of friction and advective terms on the results were described. Bottom topography was shown to influence the results by changing the nature of the wave in the channel. Advective terms need to be included in the model if there is significant bottom slope. In real situations, the model was started with the water still and the surface flat. In the frictionless situation, spurious wave forms were produced which related to the natural frequencies of the channel. The spurious wave forms may be damped out by the specification of a high level of friction. (Singh-ISWS)
W77-03083

FLOW AND BED TOPOGRAPHY IN CURVED OPEN CHANNELS,
Tokyo Inst. of Tech. (Japan). Dept. of Civil Engineering.
H. Kikkawa, S. Ikeda, and A. Kitagawa.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 102, No. HY9, Proceedings Paper 12416, p 1327-1342, September 1976. 9 fig, 1 tab, 14 ref, 1 append.

Descriptors: *Curves, *Hydraulics, *Open channel flow, *Beds under water, *Topography, River flow, Meanders, Deposition(Sediments), Scour, Sedimentation, Rivers, Flow, Open channels, Channels.
Identifiers: *Secondary flow.

Mean flow characteristics and bed shear distributions in uniformly curved open channels were studied theoretically, and the results were compared with experiments and field observations. Next, an equation which expresses the variation of transverse bed profile was derived by considering an equilibrium of forces acting on a sand particle. It was shown that the magnitude of the secondary flow and the transverse bed slope determine the direction of sand movement. The numerical solution of the bed variation with time was compared with experiments, and it was concluded that the model employed here describes the bed variation fairly well. The stable profile of the bed was obtained analytically, and from this result, the maximum depth of scour which occurs at the outer banks was calculated. (Bhowmik-ISWS)
W77-03084

EXACT SOLUTION OF GRADUALLY VARIED FLOW,
Ahmadu Bello Univ., Zaria (Nigeria). Dept. of Civil Engineering.
M. A. Gill.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 102, No. HY9, Proceedings Paper 12406, p 1353-1364, September 1976. 1 fig, 5 ref, 2 append.

Descriptors: *Gradually varied flow, *Hydraulic design, *Hydraulic gradient, *Numerical analysis, Hydraulics, Slopes, Equations, Mathematical studies, Channels.
Identifiers: *Belanger's equation.

Exact algebraic solutions for the gradually varied flow equation were obtained for several integral and nonintegral values of the hydraulic exponents. A method of obtaining solutions for any value of the hydraulic exponents was explained. It was pointed out that the algebraic solutions can be programmed on computers for any particular flow problem, but these solutions are of academic interest only. (Bhowmik-ISWS)

HYDROLOGIC ENGINEERING METHODS FOR WATER RESOURCES DEVELOPMENT, VOLUME 5, HYPOTHETICAL FLOODS,
Hydrologic Engineering Center, Davis, Calif.
L. R. Beard.
Available from the National Technical Information Service, Springfield, Va 22161 as AD-A017 434, Price codes: A09 in paper copy, A01 in microfiche. Report HEC-IHD-0500, March 1975. 191 p, 17 fig, 19 ref, 4 append.

Descriptors: *International Hydrological Decade, *Storms, Hydrographs, Storm structure, Standards, Probable maximum precipitation, Streams, Streamflow, Computer programs, Rainfall-runoff relationships, Simulation analysis, Computer models.
Identifiers: *Storm synthesis, *Storm transportation, Storm centering, Balanced hydrographs, Standard project flood, Probable maximum flood, Storm studies, Stream system, *Hypothetical floods.

Volume 5 of a 12-volume report entitled 'Hydrologic Engineering Methods for Water Resources Development,' discussed techniques and procedures for synthesizing hypothetical rainfall-snowmelt-runoff events. Standard project and probable maximum floods simulation were those used by the Corps of Engineers. Storm centering, use of rainfall frequency data, balanced hydrographs, and several computer programs were discussed. Examples and illustrations were included. The following computer programs were included as appendices: (1) Unit Hydrograph and Hydrograph Computation Computer Program; (2) Hydrograph Combining and Routing Computer Program; (3) Balanced Hydrograph Computer Program; and (4) Streamflow Routing Optimization Computer Program. (See also W77-03105, W74-01642, and W74-13177) (Roberts-ISWS)

HYDROLOGIC ENGINEERING METHODS FOR WATER RESOURCES DEVELOPMENT, VOLUME 6, WATER SURFACE PROFILES,
Hydrologic Engineering Center, Davis, Calif.
W. A. Thomas.
Available from the National Technical Information Service, Springfield, Va 22161 as AD-A017 435, Price codes: A07 in paper copy, A01 in microfiche. Report HEC-IHD-0600, August 1975. 122 p, 33 fig, 4 tab, 32 ref.

Descriptors: *Hydraulics, *Hydrology, *Water resources development, Free surfaces, Computer models, Mathematical studies, Computers, Automation, Equations, Engineering, Profiles, Computer programs.
Identifiers: *Free surface flow, *Water surface profiles, Energy component.

Volume 6 was part of a 12-volume report entitled 'Hydrologic Engineering Methods for Water Resources Development,' prepared as a part of t Corps of Engineers' participation in the Intern tional Hydrological Decade. This volume relat the mathematical equations for flow in natu channels to the physical process. The most co mon method for solving these basic equations, t standard step method, was developed for compl cross sections using techniques which are suitab for both hand and computer calculations. One the objectives of this volume was to delineate t degree of simplification that is appropriate f analysis of water surface profiles in natural cha nels. The procedures were illustrated by solving example problem by manual computations; ho ever, the more common practice in the Corps Engineers was to utilize electronic computers calculate water surface profiles. Programs for t purpose are readily available. (See also W7 03104, W74-01642, and W74-13177) (Rober ISWS)

SCOUR AROUND BRIDGE PIERS,
West Virginia Univ., Morgantown. Engineeri Experiment Station.
G. R. Hopkins, R. W. Vance, and B. Kasraie.
Available from the National Technical Inform tion Service, Springfield, VA 22161 as PB-249 67 Price codes: A10 in paper copy, A01 in microfich Report FHWA-RD-76-56, March 1975. 205 p, 1 fig, 10 tab, 111 ref, 4 append. DOT-FH-11-7759.

Descriptors: *Scour, *Bridges, *Rivers, *Pie Model studies, Mathematical models, On-site i vestigations, Measurement, Instrumentatio Equipment, Depth, On-site data collectio Velocity, Fathometers, Water circulation, Er sion, Sediments.
Identifiers: *Pier scour, Scour formulas, Scour i strumentation, Scour field data collection.

Available theories and prediction formulas scour at bridge waterways were reviewed. Form las that offer potential for prediction of sco around bridge piers were compared by reduci each formula to a non-dimensional form that i cludes Froude number, the ratio of scour depth pier width, and the ratio of stage to pier width. field study to gather data on scour and related va ables was described. The study was aimed at c lecting field data in order to furnish a basis which to compare scour prediction formulas. Fo test sites were included in the study. These sit were located on: (1) the Red River in Shrevepo Louisiana; (2) the Brazos River in Richmon Texas; (3) the Homochitto River near Broo haven, Mississippi; and (4) the Ohio River Lawrenceburg, Indiana. An automatic instrume tation system that measures scour depth at thr points around a bridge pier as well as river sta was used in this study. The system was based on depth measuring fathometer. The test protocol a study philosophy were discussed. Data gather from the field sites were presented and compar to values predicted from scour formulas. Recor mendations were made on ways to improve th scour research effort. Recommendations includ improved instrumentation systems, addition field studies, laboratory studies computer progra development. (Sims-ISWS)

ntifiers: Nearshore currents, Offshore break-
ers, Shore-connected breakwaters, Diffrac-
.

s study provided a semi-empirical theory of
rshore currents due to breaking waves in the
sence of a shore-connected breakwater or an
shore breakwater. The effects of diffraction
e studied in addition to refraction by shoaling
ers. The concept of radiation stresses applied
uniform longshore current and rip currents
med the starting point of the theory. Many em-
cal relations included in this study with regard
he surf zone are similar to, and extrapolations
the ones used in related works. Ignoring con-
tive inertia and lateral turbulent diffusion, the
erning equations were solved numerically by
method of finite differences. Sample results
stream functions and mean sea levels were
tted for various beach profiles or incidence an-
s. For the offshore breakwater, the predicted
rent pattern is consistent with available labora-
y observations and the known tendency of tom-
o formation; for the shore-connected break-
er, the computed flow pattern exhibits cells in
h downwave and upwave regions. Directly rele-
t observations have not been found, but part of
predicted features has some indirect experi-
ntal support. More experimental and theoretical
rk was suggested. (Sims-ISWS)

ervations at numerous cross sections in a side
r channel showed that the total energy of flow
reases substantially along the channel, which is
trary to the assumption that has frequently
n made. The decrease in total energy occurs
ause the longitudinal component of velocity of
spill flow is greater than the longitudinal
city of the flow remaining in the channel. A
sfactory flow equation was derived from mo-
tum principles. The equation was further
eloped into a computer technique for calculat-
flow profiles and spill discharges for side
rs. (Lee-ISWS)

LANDSLIDE GENERATED WATER WAVE MODEL,
Alabama Univ., University. Dept. of Engineering Mechanics.
D. C. Raney, and H. L. Butler.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 102, No. HY9, Proceedings Paper 12425, p 1269-1282, September 1976. 9 fig, 1 tab, 8 ref, 2 append.

Descriptors: *Reservoirs, *Montana, *Waves(Water), *Mathematical models, Landslides, Numerical analysis, Hydraulics, Hydrodynamics, Equations, Simulation analysis, Model studies.
Identifiers: *Water wave models, Rockfalls.

A numerical model was developed for simulating the development and propagation of landslide generated water waves in reservoirs. The numerical model was based upon a finite difference representation of the depth averaged hydrodynamic equations. The landslide is formulated as a moving boundary condition, propagating into the reservoir, and accelerating the fluid due to physical displacement and viscous drag. Arbitrary reservoir geometry and landslide parameters can be considered. The numerical model results were compared with experimental results obtained on a 1:120 undistorted scale physical model of Libby Dam and Lake Koocanusa in Montana. Landslides were considered, reflecting a wide range of landslide volumes and velocities. The wave heights predicted by the numerical model were in good agreement with the wave heights observed in the physical model. (Lee-ISWS)

HYDROLOGY AND ENVIRONMENTAL ASPECTS OF ERIE CANAL (1817-99),
Geological Survey, Reston, Va. Water Resources Div.
W. B. Langbein.
Available from the Supt. of Documents, GPO, Wash., D.C. 20402, Price $1.20. Water-Supply Paper 2038, 1976. 92 p, 12 fig, 7 tab, 67 ref.

Descriptors: *Canals, *Inland waterways, *Lake Erie, *Transportation, *Environmental effects, Water quality, Water pollution, Floods, Ships, Appraisals, Hydrology, Sediments, Economics, Hydraulics, Land development, History.
Identifiers: *Erie Canal.

As the first major water project in the United States, the old Erie Canal provides an example of the hydrological and environmental consequences of water development. The available record shows that the project aroused environmental fears that the canal might be impaired by the adverse hydrologic effects of land development induced by the canal. Water requirements proved greater than anticipated, and problems of floods and hydraulic inefficiencies beset navigation throughout its history. The Erie Canal proved the practicality of major hydraulic works to the extent that operations and maintenance could cope with the burdens of deficiencies in design. Among the large set of effects of the canal upon the water environment that took place but that had not been considered in the planning or design were those on river flows, landforms, ground water, vegetation, and fish migration. The overriding fact that the initial anxieties of the planners proved unwarranted and that environmental conditions did not become intolerable by the standards of that time probably led to neglect of consideration of environmental risks in subsequent public works practice during the 19th century. MECHANICAL MOLE BURROWS SEWER TUNNEL,
Public Works, Vol. 107, No. 11, p 62-63, November, 1976. 1 fig.

Descriptors: *Sewers, *Construction equipment, *Safety, *Tunnelling machines, *Tunnelling, Costs.

The use of a boring machine to create a sewer tunnel in Quincy, Illinois, was evaluated. With this machine, it was possible to build a tunnel with 50 percent increased sewage outflow capacity at no additional costs. Safety margins were greater and the problems associated with blast and drill methods were avoided. The machine bored a tunnel 8 feet, 2 inches, by 5 feet, 3 inches wide as compared to an 8-foot diameter tunnel originally planned. With this method, damage to surrounding rock by blasting was avoided. The horseshoe shape of the board tunnel allowed additional height for maintenance headroom and the smaller arch gives the tunnel greater strength and stability. Tunnel construction proceeded at rates similar to conventional drill and blast methods while overbreak and fracturing due to blasting were avoided. The operation of the machine was similar to a milling machine that shaves metal surfaces. (Collins-FIRL)

LARGE FACTORY-BUILT PUMP STATION BEGINS OPERATION.
Water and Sewage Works, Vol. 123, No. 8, p 86, August, 1976.

Descriptors: *Pumps, *Sewerage, *Energy, Control systems, Design criteria, Waste water treatment, Equipment, Sewers, Pipelines, Operating costs, Kansas.
Identifiers: Pumping stations, Kansas City(Kan).

As part of its new sewage project, Kansas City, Kansas, installed a new pump station. The station employs a variable frequency control system with two 200-hp pumps and another on standby. It can pump 11,250 gallons per minute of waste water up a 77.1 ft head through 44 in. sewer lines. It is designed to provide more interior room and use less steel, and can accomodate a variety of pump types inside. The energy efficient design should provide substantial operational savings. EARTH AND ROCK-FILL DAMS: BASIS OF THEIR DESIGN AND CONSTRUCTION, SECOND EDITION,
S. N. Moiseev.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-248 217, Price codes: A99 in paper copy, A01 in microfiche. Technical Translation 72-58002, 1975. 647 p, 227 fig, 21 tab, 53 ref. Translation of monograph Kemenno-Zemlianye i Kamennonabrosnye Plotiny Osnovy Proektirovaniia i Stroitelstva, Moscow (USSR), 1970.

Descriptors: *Dams, *Dam design, *Dam construction, *Rockfill dams, *Earth dams, Construction, Construction materials, *Design, Maintenance, Dimensions, Foundations, Embankments, Dam foundations, Labor, Soil mechanics, Rocks, Reinforced concrete, Climates, Cold weather construction, Civil engineering.
Identifiers: *USSR.

An analysis of the design, construction, and exploitation of the most economical types of earth-fill and rock-fill dams was given on the basis of local and foreign literature. Great attention was given to the production of work during the time of erection of the dam, the materials used and their preparation, the equipment used in laying the materials in the body of the dam, and the construction of the anti-filtration constructions. Examples of existing dams were mentioned which gives the possibility of choosing the most rational methods of constructing works in accordance with various conditions. (Sims-ISWS)

UNDRAINED BEHAVIOR OF EMBANKMENTS ON NEW LISKEARD VARVED CLAY,
Massachusetts Inst. of Tech., Cambridge. Dept. of Civil Engineering: and Massachusetts Inst. of Tech., Cambridge. Constructed Facilities Div.
S. M. Lacasse, C. C. Ladd, and A. K. Barsvary.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-251 002, Price codes: A04 in paper copy, A01 in microfiche. Report No. R-75-45, June 1975. 58 p, 17 fig, 2 tab, 27 ref, append. R23-0.

Descriptors: *Embankments, *Varves, *Canada, Clays, Bank stability, Stress analysis, Soil strength, Pore pressure, Finite element analysis, Drainage, Anisotropy, Consolidation, Failures, On-site tests, Laboratory tests, Deformation.
Identifiers: *Soft soil, *Undrained pore pressures.

The performance, including a failure, of two embankments in New Liskeard, Canada was analyzed. The underlying 150 ft (45.8 m) of medium-to-soft varved clay was studied with respect to stability, undrained deformations, and excess pore pressure distribution. Total stress stability analyses were performed with undrained strengths based on measured and corrected field vane strengths, the average UC and UU strength, and SHANSEP strength parameters with and without anisotropy. Several approaches yielded satisfactory factors of safety and reasonable critical arcs. Effective stress analyses using pore pressures predicted from finite element analyses showed that either the effective stress strength parameters were much lower than those measured in the laboratory or the predicted pore pressures at failure were much too low. Undrained deformations and excess pore pressures at end of construction were predicted with the finite element program FEECON. The values were generally consistent with field measurements for an embankment located 200 ft (61.0 m) from the failure area. (Visocky-ISWS)

PIPING IN EARTH DAMS CONSTRUCTED OF DISPERSIVE CLAY; LITERATURE REVIEW AND DESIGN OF LABORATORY TESTS,
Army Engineer Waterways Experiment Station, Vicksburg, Miss. Soils and Pavements Lab.
E. B. Perry.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A018 695, Price codes: A07 in paper copy, A01 in microfiche. Technical Report S-75-15, November 1975. 125 p, 66 fig, 10 tab, 142 ref, 3 append.

Descriptors: *Earth dams, *Porous media, *Saturated flow, *Hydraulic structures, *Reviews, *Australia, Laboratory tests, Laboratory equipment, Soil analysis, Testing, Soil erosion, Soil chemical properties, Soil physical properties, Soil mechanics, Pore pressure, Cohesive soils, Clays, Illite, Publications, Clay minerals, Kaolinite, Montmorillonite, Permeameters, Seepage.
Identifiers: *Piping(Erosion), Dispersive clays, Crumb test.

It was assumed when empirical piping criteria were developed 25 years ago that soil type and method of construction were the main parameters controlling the resistance of homogeneous earth dams to piping failure. Research on piping failure in earth dams constructed of dispersive clay (a particular type of soil in which the clay fraction erodes in the presence of water by a process of deflocculation) was initiated in Australia about 15 years ago. This research resulted in a method of analysis to assess the susceptibility of a homogeneous earth dam, constructed of predominately illite or montmorillonite clay, to dispersive clay piping. The first study of dispersive clay in the United States, reported in 1972, developed a relationship between percent sodium and total soluble salts in the soil pore water extract and field performance of earth dams as evidenced by piping failure or rainfall erosion damage. This research has demonstrated the usefulness of the pinhole erosion test as a method of identifying dispersive clays, shown the feasibility of using filters to prevent piping in dispersive clays, and indicated that stabilization of dispersive clays is possible. A laboratory pinhole erosion apparatus was designed and constructed at the Waterways Experiment Station (WES). A series of laboratory tests was designed to standardize a procedure for use of the pinhole erosion test as a method of identifying dispersive clays, evaluating the effectiveness of filters in preventing piping in dispersive soils, and determining the influence of selected parameters on erodibility of dispersive clays. The procedure for conducting the Crumb Test was given in Appendix A, and Appendixes B and C present detailed drawings and photographs, respectively, of the WES laboratory erosion test apparatus. '. Concrete

EVALUATION OF SELECTED INSTRU- NTS USED TO MEASURE THE MOISTURE NTENT OF HARDENED CONCRETE,
ny Engineer Waterways Experiment Station, ksburg, Miss. Concrete Lab.
F. O'Neil, and J. E. McDonald.
ailable from the National Technical Informa- n Service, Springfield, VA 22161 as ADA-022 , Price codes: A02 in paper copy, A01 in rofiche. Technical Report C-76-1, February 6. 69 p, 8 fig, 33 plates, 2 ref.

scriptors: *Concretes, *Moisture content, strumentation, Measurement, Equipment, aluation, Laboratory tests, Moisture meters, ges, Construction, Construction materials, terials engineering, Civil engineering.
ntifiers: *Concrete moisture.

types of gages for measuring moisture content hardened concrete were studied to determine their behavior in long-term service. The gages were evaluated with respect to stability of measurement and response to moisture change. The gages were mounted in a 12- by 12- by 18-in copper box, and the box was filled with concrete and a copper lid soldered to it. The gages were monitored for a period of 800 days. For the first 194 days, the gages were read in a hermetically sealed environment. Then, for 326 days (194 to 520 days), the copper lid was removed and the box was exposed to a 50% relative humidity atmosphere. From 520 to 722 days, the concrete specimen was exposed to 50% relative humidity after being entirely removed from the copper box. For the last 78 days of the test, from 722 to 800 days, the bare concrete block was monitored in a 100% relative humidity atmosphere (fog room). The results of the test indicated that two gages (the ionic barrier moisture gage and the Bouyoucos moisture gage) reacted the most favorably during the entire 800-day test period. Both of the mentioned types of gages gave results that were responsive to environmental changes and stable with respect to time. (Sims-ISWS)

DUCTILE IRON PIPE SOLVES A TOUGH SEWER PROBLEM AT JIMERSON CREEK,
T. F. Stroud.
Ductile Iron Pipe News, p 9-11, Spring-Summer, 1976.

Descriptors: *Sewerage, *Pipelines, *Iron, Maintenance, Waste water treatment, Infiltation, Inflow, Joints(Connections), Construction materials.
Identifiers: *Ductile iron pipe, Rubber gaskets.

Ductile pipe was used to replace deteriorated sewer piping at Jimerson Creek near Little Rock, Arkansas. Ductile iron pipe was chosen because of its ability to withstand harsh bedding conditions without breaking and the protection it provides against large rocks and other debris in the Creek. Permanence and low-maintenance needs were also prime considerations. Rubber-gasketed joints helped to eliminate infiltration/inflow which had been a problem with the older concrete mortar joints previously used. Completed in 1975, the ductile iron line performed much as expected. (Collins-FIRL)
W77-03398

INNOVATIONS IN SEWER DESIGN AND CONSTRUCTION,
Richardson (Edward H.) Associates, Inc., Newark, Del.
D. L. Willis.
Public Works, Vol. 107, No. 11, p 44-47, November, 1976.

Descriptors: *Sewerage, *Manholes, *Cost analysis, *Plastic pipes, *Construction equipment, Construction costs, Delaware, Pipelines, Safety factors.
Identifiers: *Trenchless sewers.

A trenchless sewer construction demonstration (E.P.A. Project No. S-800690) was described. The project's purpose was the development of construction techniques in which it would not be necessary to have a man enter a construction trench. Another design intent was the redefinition of relative factors such as manhole needs and design. Bethany Beach, Delaware, was chosen as the demonstration site. Preliminary cost studies projected as much as 25 percent savings over traditional construction methods. The machinery involved plows open an earth section and pulls in a length of polyethylene pipe. There were minor problems with pipe tension, 'floating' pipes, and cold-weather brittleness of the PVS pipes. The fiscal savings and safety aspects of this construction method are expected to make it an attractive alternative to more traditional procedures. (Collins-FIRL)

PRECAUTIONS TO BE TAKEN IN THE CONSTRUCTION AND MAINTENANCE OF WATER SUPPLY AND SEWER SYSTEMS (PRECAUTIONS A PRENDRE DANS LA CONSTRUCTION ET L'ENTRETIEN DES RESEAUX D' AQUEDUC ET D' EGOUT),
Yvan Asselin.
Eau du Quebec, Vol. 9, No. 3, p 8-9, August, 1976.

Descriptors: *Surveys, *Inspection, *Maintenance, *Water supply, *Sewerage, Water distribution(Applied), Pipelines, Valves, *Canada.
Identifiers: Fountains, Quebec.

A survey performed on the water treatment practices of the 155 towns in Quebec with populations of 5000 or more revealed that the levels of inspection and cleaning of water lines were generally low. Improvements in quality and service could be achieved by checking valve operation at least twice a year, checking operation of street fountains three or four times a year, cleaning the water lines at least twice a year, checking the sewage lines regularly and cleaning them at least twice a year, and seeking and eliminating leakage. Application of modern construction techniques can eliminate many potential or actual problems; these techniques include proper preparation of the pipe beds, packing a filler around the pipes, sealing the joints with rubber, providing inspection points with constrictions to maintain flow speeds, ensuring easy access to inspection sites, firmly connecting the cesspools, providing for electrical conductivity of water supply lines, selecting optimal valves, and establishing proper anchoring and drainage for street fountains. Modern devices are available for leakage and continuity detection. (Text in French) (Henson-FIRL)

8I. Fisheries Engineering

ENVIRONMENTAL INVENTORY AND ASSESSMENT OF NAVIGATION POOLS 24, 25, AND 26, UPPER MISSISSIPPI AND LOWER ILLINOIS RIVERS; AN ELECTROFISHING SURVEY OF THE ILLINOIS RIVER,
Illinois Natural History Survey, Havana. River Research Lab.
R. E. Sparks.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A020 069, Price codes: A06 in paper copy, A01 in microfiche. Contract Report Y-75-4, December 1975. 122 p, 5 fig, 36 tab, 67 ref. Army DACW39-74-M-3084.

Descriptors: *Rivers, *Fish, *Mississippi River, *Surveys, *Fish populations, Navigable rivers, Electro-fishing, Fish food organisms, Fish types, Freshwater fish, Pollutants, Fish diseases, Sediments, Turbidity, Suspended solids, Water pollution, Water pollution sources, Water pollution effects, Water levels, Fisheries, Commercial fishing, Biology.
Identifiers: *Illinois River.

The fish populations of the Illinois River were sampled in the autumn of 1974 by means of a 220-volt AC electroshocker. The sampling was done as part of an environmental inventory and assessment of effects of maintenance and operation of the 9-ft navigation channel in Pools 24, 25, and 26 on the Upper Mississippi River and lower 80 miles of the Illinois River. Comparative data were available from similar electro-fishing surveys conducted from 1959 through 1973. Commercial fishing statistics and results of earlier fish surveys were available as far back as the 1870's. The Illinois River begins at the confluence of the Kankakee and Des Plaines Rivers. The effect of municipal and industrial discharges from the Chicago-Joliet area was evident in electro-fishing catches from the Des Plaines River--only the introduced carp, goldfish, and hybrids of these two pollution-tolerant species were abundant, and most were diseased. There was a greater variety and abundance of fishes in the Illinois River compared to the Des Plaines River, and the fish were generally in better condition. The greatest catches of commercial and game fishes came from La Grange and Peoria Pools (Middle Illinois River), which have the largest connecting lake area. Impacts of physical-chemical changes in the river on the fish populations were reported. (Sims-ISWS)

An unusual Water Resource Research accomplishment of the year's program was the first major review of the state's critical water problems and the planning for research and data collection to solve Hawaii's problems in a joint study by the Hawaii Water Resources Regional Study and the Center. Among 9 water problem areas, over 20 specific study needs were identified. An unprecedented number of projects (34) comprised the year's program and the concentration of projects was in the field of water and sediment qualities and biota. Laboratory analytical methodology was established for identifying possible carcinogens in water, municipal waste waters were tested for pesticides and heavy metals, algal growth potential was determined for natural and waste waters. Water supply, flood, and drought-related research and data collection systems were conducted. Groundwater and the associated water infiltration through soils were studied. Water recycling from municipal and domestic waste water effluent for sugarcane irrigation gained acceptance not only as a supplement to the agricultural water supply, but also as an alternative to ocean disposal of waste water for the islands of Oahu, Maui, and Kauai. The study of pathogenic enteric viruses associated with sewage continued to be a major research program of the Center.

REPORT ON TENTH ANNUAL WATE RESOURCES RESEARCH CONFERENC SPONSORED BY OFFICE OF WATE RESEARCH AND TECHNOLOGY, APRIL 9-1 1975.
Office of Water Research and Technolog Washington, D. C.
Available from the National Technical Inform tion Service, Springfield, VA 22161 as PB-262 44 Price codes: A05 in paper copy, A01 in microfich (1976), 95 p.

Descriptors: *Conferences, Water resources i stitute, *Water Resources Research Ac *Research and development, *Allotments, Feder government, *Research priorities, *Federal pr ject policy, Grants, Contracts, Federal budget State governments.

The tenth conference, held under the auspices the newly formed Office of Water Research a Technology (a creation which consolidated the a tivities of the Office of Water Resources Resear and the Office of Saline Water) convened Washington, D. C., April 9-10, 1975. The asse blage constituted persons involved in water pr grams, such as the Directors of the State Wat Resources Research Institutes and other represe tatives and observers, from the entire spectrum the nationwide water community, including for t first time, representatives concerned with sali water conversion activities. The 1975 Conferen theme focused on Technology Transfer. The fo plenary sessions delved into topics such as t Congressional viewpoint regarding the water pr gram, technology transfer in action, a review the saline water conversion program and a prese tation on the recommendations of the 1974 Wat Resources Research Advisory Panel highlight w a presentation by Dr. A. R. Chamberlain, Pr sident of Colorado State University, representi the National Association of State Universities a Land Grant Colleges on the Joint Department the Interior/NASULGC Water Research and Ed cation Advisory Committee.

10. SCIENTIFIC AND TECHNICAL INFORMATION

10C. Secondary Publication And Distribution

PUBLICATIONS LIST OF THE IDAHO WATI RESOURCES RESEARCH INSTITUTE,
Idaho Univ., Moscow. Water Resources Resear Inst.
Available from the National Technical Inform tion Service, Springfield, VA 22161 as PB-262 3 Price codes: A04 in paper copy, A01 in microfic April 1976, 35 p. OWRT A-999-IDA(7).

Descriptors: *Bibliographies, Informati retrieval, *Publications, *Idaho, *Wa Resources Institute, Grants, Contracts, Docume tation, *Information exchange.

Compilation has been made of all reports, thes and journal articles prepared in conjunction w research activities of the Idaho Water Resour Research Institute. Both an author and a subj index are used to assist the reader in locating dividual reports. The publications are listed project under four main headings: OWRT All ment project; OWRT Matching Grant projec OWRT Title II projects; and miscellaneous pu cations. (Trihey-Idaho)

nsmission, *Information exchange,
ocumentation, Information retrieval.
ntifiers: *Information dissemination, *Western
ited States.

ports on current water information dissemina-
n activities by the states stressed that each of us
eds to know what the other is doing; duplication
effort among the several State water institutes
agencies is to be avoided; and for what duplica-
n already exists, the antidote is coordination of
ort. It was also brought out that the public in-
asingly wishes to be involved in water
ources planning, so that an interpersonal
earcher-user contact seems to be required. To
ablish the desired contact, some kind of com-
n language is needed by which water informa-
n and research results can be translated into
ms meaningful to the user. Toward this end,
cialists are needed who can at once understand
researcher's language and also comprehend
user's practical needs. In the State panel
cussion it was recognized that more water in-
mation is available than can be assimilated in
gmented form by the public sectors; the inter-
diary therefore must develop 'organized infor-
tion' and convey it in some structured form to
user. In the Interstate panel discussion it was
ggested that, where a credibility gap exists
tween research and its application, the proper
sponse is a broad dissemination of selected
nds of processed information to selected public
ctors. Regarding computerized water data
rage and retrieval systems, it was agreed that a
gional data system may not be feasible at this
ne, but that an exchange of existing program
scriptions and subroutines, a degree of stan-
rdization of data coding forms, and a coopera-
e evaluation of existing data systems, would be
sirable for coordinated action among the
stern states.

FAULTS (GEOLOGIC)
Fault History of the Pribilof Island and Its Relevance to Bottom Stability in the St. George Basin,
W77-03256 2L

Earthquake Activity and Ground Shaking in and Along the Eastern Gulf of Alaska,
W77-03257 2L

FEASIBILITY
Ammonia Removal from Wastewater by Ligand Exchange,
W77-03367 5D

FEDERAL PROJECT POLICY
Report on Tenth Annual Water Resources Research Conference, Sponsored by Office of Water Research and Technology, April 9-10, 1975.
W77-03206 9D

California Water Project: Law and Politics,
W77-03583 6E

FEDERAL RECLAMATION LAW
California Water Project: Law and Politics,
W77-03583 6E

FEDERAL WATER POLLUTION CONTROL ACT
Virginia State Program for Control of Discharge of Pollutants to Navigable Waters; Approval.
W77-03527 5G

Organic Chemicals Manufacturing Point Source Category-Effluent Limitations and Guidelines (Amendments to Regulations-Butadiene).
W77-03528 5G

Proposed Toxic Pollutant Effluent Standards.
W77-03529 5G

The Muddy Road to Clean Water,
W77-03587 5G

FEEDING RATES
Effect of Copper on Some Aspects of the Bioenergetics of Rainbow Trout (Salmo gairdneri),
W77-03203 5C

FERMENTATION
Fermentation of Waste Materials to Produce Industrial Intermediates,
W77-03563 5D

FERTILIZATION
Determining the Most Profitable Nitrogen Fertilization for Corn Production,
W77-03172 3F

FERTILIZERS
The Impact of Intensive Application of Pesticides and Fertilizers on Underground Water Recharge Areas which May Contribute to Drinking Water Problems,
W77-03567 5B

FIELD GEOMETRY EFFECTS
Evapotranspiration Reduction by Field Geometry Effects,
W77-03169 2D

FILTERS
The Rotating Biological Filter,
W77-03282 5D

High Gradient Magnetic Filtration,
W77-03418 5D

Laboratory Studies on the Effects of Temperature on Accumulation of Solids in Biological Filters,
W77-03464 5D

FILTRATION
High Gradient Magnetic Filtration,
W77-03418 5D

'Give Flotation a Try' was Challenged.
W77-03439 5F

Small Village Gets Advanced Treatment.
W77-03440 5D

FINAL SETTLING TANKS
Dynamic Response of Final Settling Tanks to Transient Loading Conditions,
W77-03156 5D

FINITE ELEMENT ANALYSIS
A Three-Dimensional Finite Element Ground Water Model,
W77-03109 2F

Supplement to Documentation of Finite-Difference Model for Simulation of Three-Dimensional Ground-Water Flow,
W77-03329 2F

FISH
Experimental Studies on the Second Intermediate Hosts of Clonorchis Sinesis: III. Observations on the Relationship Between Clavate Cells of Epidermis and Infectivity of Metaceracariae of Clonorchis Sinesis in Freshwater Fish, (In Korean),
W77-03161 5C

Environmental Inventory and Assessment Navigation Pools 24, 25, and 26, Upper Mis sippi and Lower Illinois Rivers; An Electrof ing Survey of the Illinois River,
W77-03302

Poisoning of, and Obstruction to, Fish.
W77-03500

FISH BEHAVIOR
Effects of Mercury and Copper on the Olfa ry Response in Rainbow Trout, Salmo G neri,
W77-03184

FISH DISEASES
Experimental Studies on the Second I mediate Hosts of Clonorchis Sinesis: III. servations on the Relationship Between Cl Cells of Epidermis and Infectivity Metaceracariae of Clonorchis Sinesis in F water Fish, (In Korean),
W77-03161

Incidence of Pathology of Marine Fish eases in the Gulf of Alaska, Bering Sea, Beaufort Sea,
W77-03226

FISH FARMING
Northwest Mariculture Laws,
W77-03598

FISH MIGRATION
Reproduction by Adfluvial Salmonids in S Creek, Cache County, Utah,
W77-03160

FISH PARASITES
Experimental Studies on the Second mediate Hosts of Clonorchis Sinesis: III servations on the Relationship Between C Cells of Epidermis and Infectivity Metaceracariae of Clonorchis Sinesis in F water Fish, (In Korean),
W77-03161

FISH PHYSIOLOGY
Effects of Mercury and Copper on the Ol ry Response in Rainbow Trout, Salmo G neri,
W77-03184

FISH POPULATIONS
Environmental Inventory and Assessm Navigation Pools 24, 25, and 26, Upper M sippi and Lower Illinois Rivers; An Elect ing Survey of the Illinois River,
W77-03302

FISH REPRODUCTION
Reproduction by Adfluvial Salmonids in Creek, Cache County, Utah,
W77-03160

FISHERIES
Limnological Characteristics of Strip Ponds in Northwestern Colorado, U.S.A.
W77-03538

FISHES
Environmental Status of the Lake M Region. Vol. 17. Inland Fishes of the Michigan Drainage Basin,
W77-03566

FISHING
Pollution of Interstate Waters of the Columbia River Bonneville Dam to Cat Washington.
W77-03385

Sweeping Sea Law in 1976.
77-03533 6E

IKILL
ate Dept of Pollution Control V International per Co. (Determination of Fish Value That re Killed by Pollutants).
77-03498 6E

SH FLOODS
idelines for Flash Flood and Small Tributary ood Prediction,
77-03114 4A

OD CHANNELS
ood Control Projects and Drought Emergen-es.
77-03505 6E

OD CHARACTERISTICS
ood Plain Information: Contoocook River d Nubanusit Brook, Peterborough, New ampshire.
77-03177 4A

OD CONTROL
ood Control Projects and Drought Emergen-es.
77-03505 6E

ood Disaster Protection Act of 1973,
77-03522 6F

an for Improvement of the Delta Levees.
77-03550 4A

rps' New Look in Flood Control: No Dams, evees,
77-03593 4A

OD DAMAGE
ood Plain Information: Kaskaskia River and ributaries, Coles County, Illinois,
77-03175 4A

ood Disaster Protection Act of 1973,
77-03522 6F

OD DATA
ood Plain Information: Tuscarawas and Ad-cent Tributary Areas, Tuscarawas County, hio.
77-03174 4A

ood Plain Information: Contoocook River d Nubanusit Brook, Peterborough, New ampshire.
77-03177 4A

ood Plain Information: Wildcat Creek and okomo Creek, Vicinity of Kokomo, Howard ounty, Indiana.
77-03182 4A

OD EVENTS
e Unit Hydrograph: A Satisfactory Model of atershed Response,
77-03126 4D

OD FLOW
oodflow Characteristics at Proposed Bridge te Above Sherwood Road on West Branch elaware River, Delhi, New York,
77-03337 4A

OD FORECASTING
etransmission of Hydrometric Data in anada,
77-03111 7B

uidelines for Flash Flood and Small Tributary ood Prediction,
77-03114 4A

Flood Plain Information: Wildcat Creek and Kokomo Creek, Vicinity of Kokomo, Howard County, Indiana.
W77-03182 4A

Depth and Frequency of Floods in Illinois,
W77-03346 2E

FLOOD FREQUENCY
Floodflow Characteristics at Proposed Bridge Site Above Sherwood Road on West Branch Delaware River, Delhi, New York,
W77-03337 4A

Depth and Frequency of Floods in Illinois,
W77-03346 2E

FLOOD PLAIN INSURANCE
Flood Disaster Protection Act of 1973,
W77-03522 6F

FLOOD PLAIN ZONING
Flood Plain Information: Wildcat Creek and Kokomo Creek, Vicinity of Kokomo, Howard County, Indiana.
W77-03182 4A

Faulting and Instability of Shelf Sedimen Eastern Gulf of Alaska,
W77-03259

Seismic and Volcanic Risk Studies - West Gulf of Alaska,
W77-03260

Faulting and Instability of Shelf Sediment Western Gulf of Alaska,
W77-03264

A Historical Summary of Earthquake Epic ters in and Near Alaska,
W77-03265

GULF OF MEXICO
Joint Probability Method of Tide Freque Analysis Applied to Apalachicola Bay and George Sound, Florida,
W77-03304

HABITATS
Destructive Grazing of Kelp by Sea Urchin Eastern Canada,
W77-03199

HACKENSACK RIVER BASIN (NJ)
Appraisal of Water Resources in the Hack sack River Basin, New Jersey,
W77-03336

HAIL
A Review of Hail-Measuring Instruments,
W77-03101

HAIL SENSORS
A Review of Hail-Measuring Instruments,
W77-03101

HATTERAS ABYSSAL PLAIN
The Bottom Boundary Layer of the D Ocean,
W77-03089

HAWAII
Annual Report, 1975-1976, (Hawaii W Resources Research Center),
W77-03165

Calibration of Neutron Probe in Some Sele Hawaiian Soils,
W77-03321

HAZARDOUS MATERIALS
Degradation Mechanisms: Controlling Bioaccumulation of Hazardous Materials,
W77-03391

HAZARDS
Marine Climatology of the Gulf of Alaska the Bering and Beaufort Seas. Part III. Clim Atlases,
W77-03240

A Seismotectonic Study of Seismic and canic Hazards in the Pribilof Islands - Eas Aleutian Islands Region of the Bering Sea,
W77-03243

Coastal Morphology and Sedimentation, Coast of Alaska (Glacial Sedimentation),
W77-03244

U. S. DEPT. OF I. URBANA-CHAMPAIGN

The Environmental Geology and Geomorphology of the Gulf of Alaska Coastal Plain,
W77-03246 2L

Offshore Permafrost Studies, Beaufort Sea,
W77-03249 2L

Fault History of the Pribilof Island and Its Relevance to Bottom Stability in the St. George Basin,
W77-03256 2L

Earthquake Activity and Ground Shaking in and Along the Eastern Gulf of Alaska,
W77-03257 2L

Faulting and Instability of Shelf Sediments: Eastern Gulf of Alaska,
W77-03259 2L

Faulting and Instability of Shelf Sediments - Western Gulf of Alaska,
W77-03264 2L

A Historical Summary of Earthquake Epicenters in and Near Alaska,
W77-03265 7C

A Study of Beaufort Sea Coastal Erosion - Northern Alaska,
W77-03266 2L

Dynamics of Near-Shore Ice,
W77-03268 2C

Dynamics of Near-Shore Ice (Data Buoys),
W77-03269 2C

Morphology of Bering Near Shore Ice Conditions by Means of Satellite and Aerial Remote Sensing,
W77-03272 2C

Morphology of Beaufort Near Shore Ice Conditions by Means of Satellite and Aerial Remote Sensing,
W77-03273 2C

Experimental Measurements of Sea Ice Failure Stresses Near Grounded Structures,
W77-03274 2C

GADGATES
Head Gates; Powers of State Engineer.
W77-03507 6E

GAT
Heat Inactivation of Poliovirus in Waste Water Sludge,
W77-03448 5C

GAVY METALS
Immediate Industrial Effects on Sediment Mercury Concentrations in a Clean Coastal Environment,
W77-03188 5B

Effect of Copper on Some Aspects of the Bioenergetics of Rainbow Trout (Salmo gairdneri),
W77-03203 5C

Heavy Metals in Lakes of the Coeur d'Alene River Valley, Idaho,
W77-03207 5B

Natural Distribution of Trace Heavy Metals and Environmental Background in Three Alaska Shelf Areas,
W77-03222 5B

Heavy-Mineral Trends in the Beaufort Sea,
W77-03254 2L

Reactions of Heavy Metals With Soils With Special Regard to Their Application in Sewage Wastes,
W77-03359 5B

HEAVY MINERAL DISTRIBUTION
Relationships Between Sand Input from Rivers and the Composition of Sands from the Beaches of Southern California,
W77-03324 2L

HEAVY MINERALS
Heavy-Mineral Trends in the Beaufort Sea,
W77-03254 2L

HERBICIDES
Practical Alternatives to 2,4,5-T for Chemical Control of Brush Along Drainage Ditches and General Watershed Use,
W77-03168 5G

HERRING-BONE PATTERNS
A 'Herring-Bone' Pattern of Possible Taylor-Gorter-Type Flow Origin Seen in Sonographs,
W77-03253 5B

HIGH WATER MARK
Freedom of Beach,
W77-03584 6E

HISTORIC FLOODS
Flood Plain Information: Kaskaskia River and Tributaries, Coles County, Illinois,
W77-03175 4A

Flood Plain Information: San Juan River and Tributaries, Farmington, New Mexico.
W77-03176 4A

Flood Plain Information: Metropolitan Region, Lincoln, Nebraska: Volume I, Summary Report; Salt Creek, Haines Branch and Beal Slough, Salt Creek Basin.
W77-03179 4A

HONEY LAKE VALLEY (CALIF)
Chemical Composition Data and Calculated Aquifer Temperature for Selected Wells and Springs of Honey Lake Valley, California.
W77-03342 2K

HOOD ARROYO (NM)
Flood Plain Information: San Juan River and Tributaries, Farmington, New Mexico.
W77-03176 4A

HORTICULTURAL CROPS
Determination of Maximum Permissible Levels of Selected Chemicals that Exert Toxic Effects on Plants of Economic Importance in Illinois,
W77-03565 5A

HOT SPRINGS
Chemical Composition Data and Calculated Aquifer Temperature for Selected Wells and Springs of Honey Lake Valley, California.
W77-03342 2K

HUMAN DISEASES
Risk of Communicable Disease Infection Associated with Waste Water Irrigation in Agricultural Settlements,
W77-03485 5C

HUMAN POPULATIONS
Water Resources of Australia and the Pattern of Population Concentrations,
W77-03278 6D

HYBRID COMPUTERS
Use of Hybrid Computer Model in Resource Planning,
W77-03523 6A

HYDRAULIC DESIGN
Cavitation From Surface Irregularities in High Velocity,
W77-03082 8B

Exact Solution of Gradually Varied Flow,
W77-03085 8B

HYDRAULIC GRADIENT
Exact Solution of Gradually Varied Flow,
W77-03085 8B

HYDRAULIC PROPERTIES
Hydraulic Characteristics of the Piney Point Aquifer and Overlying Confining Bed Near Dover, Delaware,
W77-03331 2F

HYDRAULIC STRUCTURES
Piping in Earth Dams Constructed of Dispersive Clay; Literature Review and Design of Laboratory Tests,
W77-03112 8D

HYDRAULICS
Minimum Unit Stream Power and Fluvial Hydraulics,
W77-03080 8B

Flow and Bed Topography in Curved Open Channels,
W77-03084 8B

Hydrologic Engineering Methods for Water Resources Development, Volume 6, Water Surface Profiles,
W77-03105 8B

HYDRODYNAMICS
Hydrodynamic Forces on Multiple Circular Cylinders,
W77-03081 8B

Quadratic Finite Elements in Shallow Water Problems,
W77-03083 8B

HYDROGEOLOGY
Hydrogeology of the Missouri River Flood Plain near Glasgow, Missouri,
W77-03164 2F

HYDROLOGIC BUDGET
Water Management and Regulation of Water Use,
W77-03525 6B

Hydrologic Inventory of the San Rafael Study Unit.
W77-03552 4A

HYDROLOGIC DATA
Retransmission of Hydrometric Data in Canada,
W77-03111 7B

Wet and Dry Periods of Annual Flow Series,
W77-03319 2E

HYDROLOGIC SYSTEMS
Useful Modeling Concepts for the FCD Water System,
W77-03524 6A

HYDROLOGIC TRANSPORT MODELS
OPTRM - A Hydrologic Transport Model With Parameter Optimization,
W77-03115 5B

HYDROLOGY
Hydrologic Engineering Methods for Water Resources Development, Volume 6, Water Surface Profiles,
W77-03105 8B

HYDROMETRIC DATA
Retransmission of Hydrometric Data in Canada,
W77-03111 7B

HYPOTHETICAL FLOODS
Hydrologic Engineering Methods for Water Resources Development, Volume 5, Hypothetical Floods,
W77-03104 8B

ICE
The Classification and Geomorphic Implications of Thaw Lakes on the Arctic Coastal Plain, Alaska,
W77-03296 2C

Strength of Ice Under Multiaxial Loading,
W77-03301 2C

ICE BREAKUP
Breakup Flooding and Nutrient Source of Colville River Delta During 1973,
W77-03388 5B

ICE CONDITIONS
Beaufort Sea, Chukchi Sea, Bering Strait Historical Baseline Ice Study,
W77-03275 2C

ICE COVER
Radio-Echo Layers and the Recent Stability of the West Antarctic Ice Sheet,
W77-03100 2C

Marine Environmental Problems in the Ice Covered Beaufort Sea Shelf and Coastal Regions,
W77-03250 2L

ICE FORCES
Mechanics of Origin of Pressure Ridges, Shear Ridges and Hummock Fields in Landfast Ice,
W77-03271 2L

ICE JAMS
Flood Plain Information: Contoocook River and Nubanusit Brook, Peterborough, New Hampshire.
W77-03177 4A

ICE SHEETS
Radio-Echo Layers and the Recent Stability of the West Antarctic Ice Sheet,
W77-03100 2C

IDAHO
Publications List of the Idaho Water Resources Research Institute,
W77-03154 10C

Heavy Metals in Lakes of the Coeur d'Alene River Valley, Idaho,
W77-03207 5B

Bear River Evaluation Report, 1974 Survey,
W77-03292 5B

Evaluation of Lake Milner Water Quality Model,
W77-03373 5B

The Objectives, Part I of the State Water Plan, (Idaho Water Resources Board).
W77-03544 6B

Idaho Environmental Overview,
W77-03557 6G

ILLINOIS
The Illinois Coastal Zone Management Program: First Year Work Product. Volume II. Coastal Geological Studies.
W77-03103 2H

Local Water Systems are Frequently Neglected,
W77-03121 6B

Flood Plain Information: Kaskaskia River and Tributaries, Coles County, Illinois,
W77-03175 4A

Depth and Frequency of Floods in Illinois,
W77-03346 2E

Carlson V Village of Worth (Preemption of Local Regulation of Sanitary Landfill by Environmental Protection Act).
W77-03497 6E

Village of Lombard V State Pollution Control Board (Pollution Control Board Without Authority to Impose Regionalization Upon Local Governmental Bodies).
W77-03511 6E

Determination of Maximum Permissible Levels of Selected Chemicals that Exert Toxic Effects on Plants of Economic Importance in Illinois,
W77-03565 5A

ILLINOIS RIVER
Environmental Inventory and Assessment of Navigation Pools 24, 25, and 26, Upper Mississippi and Lower Illinois Rivers: An Electrofishing Survey of the Illinois River,
W77-03302 8I

IMPERIAL VALLEY (CALIF)
Selected Data on Water Wells, Geothermal Wells, and Oil Tests in Imperial Valley, California,
W77-03348 7C

IMPLICIT SCHEME
Quadratic Finite Elements in Shallow Water Problems,
W77-03083 8B

INCINERATION
Combined Process of Pyrolysis and Combustion for Sludge Disposal,
W77-03415 5D

Sludge Incineration,
W77-03419 5E

Sewage Sludge Treatment System,
W77-03487 5D

Fluidized Waste Incinerator and Method,
W77-03489 5D

INDIAN OCEAN
Rainfall in the Seychelles 1941 to 1970,
W77-03096 2B

INDIANA
Environmental Impact of Land Use on Water Quality, Progress Report,
W77-03106 5G

Flood Plain Information: Wildcat Creek and Kokomo Creek, Vicinity of Kokomo, Howard County, Indiana.
W77-03182 4A

INDUSTRIAL WASTES
Water Quality in the Calumet Area. Conference on Pollution of Lower Lake Michigan, Calumet River, Grand Calumet River, Little Calumet River, and Wolf Lake, Illinois and Indiana.
W77-03382 5B

Aquatic Field Survey at Iowa Army Ammunition Plant,
W77-03386 5C

Sludge Dewatering Pilot Plant Design, Part I,
W77-03416 5D

Waste-Treatment 'Farm' Harvests Firms.
W77-03420 5D

Proposed Toxic Pollutant Effluent Standards.
W77-03529 5C

Implementing the National Water Pollution Control Permit Program: Progress and Problems.
W77-03588 5C

The People's Lake,
W77-03594 5C

INFECTION
Risk of Communicable Disease Infection As sociated with Waste Water Irrigation i Agricultural Settlements,
W77-03485 5C

INFILTRATION
Infiltration and Water Movement in an in Sit Swelling Soil During Prolonged Ponding,
W77-03281 2C

Infiltration/Inflow Improvements in the Oyste Bay Sewer District,
W77-03401 5I

Infiltration/Inflow - The Kansas Connection,
W77-03479 5C

Conducting Sewer System Evaluations fo Small Systems,
W77-03581 5I

INFILTRATION/INFLOW
Infiltration/Inflow Improvements in the Oyste Bay Sewer District,
W77-03401 5

Infiltration/Inflow - The Kansas Connection,
W77-03479 5

Conducting Sewer System Evaluations fo Small Systems,
W77-03581 5

INFLOW
Infiltration/Inflow Improvements in the Oyst Bay Sewer District,
W77-03401 5

Infiltration/Inflow - The Kansas Connection,
W77-03479 5

Conducting Sewer System Evaluations f Small Systems,
W77-03581 5

INFORMATION DISSEMINATION
1973 Western State Conference on Water Info mation Dissemination.
W77-03166 10

INFORMATION EXCHANGE
Publications List of the Idaho Water Resourc Research Institute,
W77-03154 10

1973 Western State Conference on Water Info mation Dissemination
W77-03166 10

INJUNCTIVE RELIEF
Clippinger V Birge (Riparian Rights in an A tificial Lake).
W77-03512 6

The People's Lake,
W77-03594 5

U. of I. URBANA-CHAMPAIGN

NLAND WATERWAYS
Hydrology and Environmental Aspects of Erie Canal (1817-99),

ARVAL
Effects of Crude Oil on American Lobster (Homarus Americanus) Larvae in the Laboratory,
W77-03197 5C

ARVAL GROWTH STAGE
Effects of Crude Oil on American Lobster (Homarus Americanus) Larvae in the Laboratory,
W77-03197 5C

Effects on Fertilization and Development of the Common Mussel, Mytilus Edulis After Long-Term Exposure to a Nonionic Surfactant,
W77-03198 5C

AW ENFORCEMENT
Freedom of Beach,
W77-03584 6E

LAW OF THE SEA
A Sweeping Sea Law in 1976.
W77-03533 6E

A Closer Look at Some Issues for Genera-Oceans Policy, Marine Environment, and Fisheries,
W77-03585 6E

Coming Showdown: Ocean Nationalism and the Senate 200-Mile Shelf Bill,
W77-03591 6E

LAW OF THE SEAS CONFERENCE
A Closer Look at Some Issues for Genera-Oceans Policy, Marine Environment, and Fisheries,
W77-03585 6E

LEAF WATER POTENTIAL
Water Stress Induced Alterations of the Stomatal Response to Decreases in Leaf Water Potential,
W77-03140 2I

Diurnal Fluctuation of Leaf-Water Potential of Corn as Influenced by Soil Matric Potential and Microclimate,
W77-03394 3F

LEAVES
Changes in the Transpiration Rate and Leaf Water Content in Several Varieties of Cryptomeria Japonica Subjected to Water Stress, (In Japanese),
W77-03155 2D

LEGAL ASPECTS
The Legal Framework for Public Participation in Canadian Water Management,
W77-03543 6E

Coming Showdown: Ocean Nationalism and the Senate 200-Mile Shelf Bill,
W77-03591 6E

Water Rights,
W77-03599 6E

LEGAL REVIEW
State Dept of Pollution Control V International Paper Co. (Determination of Fish Value That were Killed by Pollutants).
W77-03498 6E

Village of Lombard V State Pollution Control Board (Pollution Control Board Without Authority to Impose Regionalization Upon Local Governmental Bodies).
W77-03511 6E

LEGISLATION
National Safe Drinking Water Strategy, One Step at a Time.
W77-03357 5G

Water Rights and Liens.
W77-03499 6E

1971 Shoreline Management Act.
W77-03514 6E

Unions Fight a Jones Act Waiver.
W77-03532 6E

The Cost of Coastal Zoning.
W77-03535 6E

The Muddy Road to Clean Water,
W77-03587 5G

Water Rights,
W77-03599 6E

LENT SQUARES METHOD
The Unit Hydrograph: A Satisfactory Model of Watershed Response,
W77-03126 4D

LETHAL LIMIT
Hygienic Substantiation of the Maximum Permissible Concentration of Tin Tributylmethacrylate in Water Bodies, (In Russian),
W77-03107 5A

Permissible Level of Benzo(A)Plyrene in Water Bodies, (In Russian),
W77-03117 5B

Effects of Crude Oil on American Lobster (Homarus Americanus) Larvae in the Laboratory,
W77-03197 5C

Effects of Chronic DDT/DDE Exposure on Anesthetic Induction and Recovery Times in Rainbow Trout (Salmo Gairdneri),
W77-03204 5C

Experimental Substantiation of the Maximal Permissible Concentrations of Triethanolamine, Ammonium and Calcium Salts of Alkylbenzosulfates in Water Bodies, (In Russian),
W77-03586 5B

LEVEES
Flood Plain Information: Wildcat Creek and Kokomo Creek, Vicinity of Kokomo, Howard County, Indiana.
W77-03182 4A

Plan for Improvement of the Delta Levees.
W77-03550 4A

LICHENS
The Effect of Oil Pollution in Bantry Bay,
W77-03194 5C

LICHNENS
Effects of Oil on Beaches in West Cork, Ireland,
W77-03192 5C

LIENS
Water Rights and Liens.
W77-03499 6E

LIGAND EXCHANGE
Ammonia Removal from Wastewater by Ligand Exchange,
W77-03367 5D

LIGHT PENETRATION
Measurement of 'Turbidity' and Related Characteristics of Natural Waters,
W77-03339 7B

LIME
Specific Role of Lime in Municipal Waste Water Treatment-Expectations and Reality (Die Spezifische Rolle Des Kalks in Der Kommunalen Abwasserreinigung-Erwartungen Und Realitaeten),
W77-03422 5D

LIMULUS ASSAY
Rapid Detection of Bacterial Endotoxins in Drinking Water and Renovated Waste Water,
W77-03474 5A

LINEAR PROGRAMMING
User Oriented Systems Analysis for Regional Municipal Water Supply Planning,
W77-03159 6A

LIQUID WASTES
Sewage Sludge Treatment System,
W77-03487 5D

LITTER
Litter and Oil on the Shores of Utsira, Rogaland County, During Autumn 1974, (In Danish),
W77-03125 5B

LITTLE SALT CREEK (NB)
Flood Plain Information: Metropolitan Region, Lincoln, Nebraska, Volume III, Summary Report, Little Salt, Oak, Salt, and Stevens Creek, Salt Creek Basin.
W77-03181 4A

LIVERPOOL BAY
Surf-Zone Water Quality in Liverpool Bay,
W77-03092 5B

LOBSTER
Effects of Crude Oil on American Lobster (Homarus Americanus) Larvae in the Laboratory,
W77-03197 5C

LOCAL GOVERNMENTS
Village of Lombard V State Pollution Control Board (Pollution Control Board Without Authority to Impose Regionalization Upon Local Governmental Bodies).
W77-03511 6E

Waterway Districts.
W77-03516 6E

LOCAL PLANNING
Local Water Systems are Frequently Neglected,
W77-03121 6B

LONG ISLAND SOUND
Seasonal Variation of Residual Drift in Long Island Sound,
W77-03322 2L

Sediment Mass Balance of a Large Estuary, Long Island Sound,
W77-03323 2L

LOS ANGELES (CALIF)
Land Based Sewage Sludge Management Alternatives for Los Angeles: Evaluation and Comparison,
W77-03289 5D

LOUISIANA
Environmental Concern as a Factor in Coastal Zone Development: A Study of Louisiana Citizens,
W77-03590 6G

LOW FLOW
Low Flow Modeling in Small Steep Watersheds,
W77-03316 4D

LUMBER
Floating Timber on Streams.
W77-03492 6E

LUMBERING
Floating Timber on Streams.
W77-03492 6E

LYSIMETER
Computation of the Potential Evapotranspiration and Their Comparison with Values of the Actual Evapotranspiration of Lysimeters, (In German),
W77-03118 2D

M.S.222
Effects of Chronic DDT/DDE Exposure on Anesthetic Induction and Recovery Times in Rainbow Trout (Salmo Gairdneri),
W77-03204 5C

MACOMA BALTHICA
Macoma Balthica: An Indicator of Oil Pollution,
W77-03185 5A

MADISON AQUIFER (WYO)
Permeability and Ground Water Circulation in the Madison Aquifer Along the Eastern Flank of the Bighorn Mountains of Wyoming,
W77-03122 2F

MADISON LIMESTONE
Plan of Study of the Hydrology of the Madison Limestone and Associated Rocks in Parts of Montana, Nebraska, North Dakota, South Dakota, and Wyoming.
W77-03338 4B

MAGNETIC FILTRATION
High Gradient Magnetic Filtration,
W77-03418 5D

MAHE
Rainfall in the Seychelles 1941 to 1970,
W77-03096 2B

MAINE
Effect of Zinc-Coated Culverts on Vertebrate and Invertebrate Fauna in Selected Maine Streams,
W77-03170 5C

MAINTENANCE
Precautions to be Taken in the Construction and Maintenance of Water Supply and Sewer Systems (Precautions a Prendre Dans La Construction Et L'Entretien Des Reseaux D' Aqueduc Et D' Egout),
W77-03400 8G

MANAGEMENT
Local Water Systems are Frequently Neglected,
W77-03121 6B

MANGANESE
A Model for the Control of Dissolved Manganese in the Interstitial Waters of Chesapeake Bay,
W77-03556 5B

MANHOLES
Innovations in Sewer Design and Construction,
W77-03399 8G

MAPPING
STD Mappings of the Beaufort Sea Shelf,
W77-03233 2L

National Program for Managing Flood Losses: Guidelines for Preparation, Transmittal, and Distribution of Flood-Prone Area Maps and Pamphlets,
W77-03341 7C

MAPS
Measured and Simulated Ground-Water Levels in the Franklin Area, Southeastern Virginia,
W77-03326 7C

Maps Showing Ground-Water Conditions in the San Simon Area, Cochise and Graham Counties, Arizona, and in Hidalgo County, New Mexico--1975,
W77-03327 7C

Maps Showing Ground-Water Conditions in the San Bernardino Valley Area Cochise County, Arizona--1975,
W77-03328 7C

National Program for Managing Flood Losses: Guidelines for Preparation, Transmittal, and Distribution of Flood-Prone Area Maps and Pamphlets,
W77-03341 7C

MARICULTURE
Northwest Mariculture Laws,
W77-03598 6E

MARINE ALGAE
Effects of Oil on Beaches in West Cork, Ireland,
W77-03192 5C

Influence of Illumination on Phytotoxicity of Crude Oil,

On the Validity of the Theory of Flow in Saturated Swelling Materials,
W77-03280 2G

AUMEE RIVER BASIN (IND)
Environmental Impact of Land Use on Water Quality, Progress Report,
W77-03106 5G

AXIMUM PROBABLE FLOOD
Probable Maximum Flood at Lake Chippewa near Winter, Wisconsin,
W77-03349 4A

EANDER LAKE (MINN)
The Impact of a Forest Fire on a Wilderness Lake in Northeastern Minnesota,
W77-03375 5B

EASUREMENT
A Review of Hail-Measuring Instruments,
W77-03101 2B

Calibration of Neutron Probe in Some Selected Hawaiian Soils,
W77-03321 2G

A Cine-Camera Technique for Process Measurement on a Ridge and Runnel Beach,
W77-03325 2L

The Electrolytic Respirometer - I. Factors Affecting Oxygen Uptake Measurements,
W77-03457 5A

ECHANICAL CONTROL
Head Gates; Powers of State Engineer.
W77-03507 6E

ECHANICAL TREATMENT (WASTES)
Comparative Assessment of the Effectiveness of Certain Methods Making Industrial Effluents Noncarcinogenic, (In Russian),
W77-03488 5D

EMBRANE PROCESSES
One Pass Seawater Desalting RO Pilot Plant Evaluation,
W77-03076 3A

Studies on a Mechanism for Salt Rejection in Reverse Osmosis Membranes as a Guide to Improved Materials for Desalination of Sea Water.
W77-03290 3A

MEMBRANES
Studies on a Mechanism for Salt Rejection in Reverse Osmosis Membranes as a Guide to Improved Materials for Desalination of Sea Water.
W77-03290 3A

MERCURY
Effects of Mercury and Copper on the Olfactory Response in Rainbow Trout, Salmo Gairdneri,
W77-03184 5C

Immediate Industrial Effects on Sediment Mercury Concentrations in a Clean Coastal Environment,
W77-03188 5B

Molecular Activation Analysis and Its Application to Methylmercury Determination in Various Marine Samples,
W77-03202 5A

MERSEY RIVER
Surf-Zone Water Quality in Liverpool Bay,
W77-03092 5B

MESOPHYL
Rates of Photosynthesis and Transpiration and Diffusive Resistance of Six Grasses Grown under Controlled Conditions,
W77-03142 2D

MESOSCALE
Weather Modification Design Study for Streamflow Augmentation in the Northern Sierra Nevada, Executive Summary,
W77-03212 3B

METABOLISM
Effect of Calcium from the Water Environment on Tissue Metabolism of Phosphates in Anodonta Cygneal, (In Russian),
W77-03366 5C

METACERCARIAE
Experimental Studies on the Second Intermediate Hosts of Clonorchis Sinesis: III. Observations on the Relationship Between Clavate Cells of Epidermis and Infectivity of Metaceracariae of Clonorchis Sinesis in Freshwater Fish, (In Korean),
W77-03161 5C

METAL IONS
Effects of Potassium on Adult Asiatic Clams, Corbicula Manilensis,
W77-03119 5C

METALS
Organic Phosphorus in Lakes,
W77-03210 5C

METEOROLOGIC DATA
Dynamics of Near-Shore Ice (Data Buoys),
W77-03269 2C

METEOROLOGICAL DATA
Marine Climatology of the Gulf of Alaska and the Bering and Beaufort Seas. Part III. Climatic Atlases,
W77-03240 5B

Near-Shore Atmospheric Modification,
W77-03242 5B

METEOROLOGY
Weather Modification Design Study for Streamflow Augmentation in the Northern Sierra Nevada, Volume I - Meteorology and Hydrology of the Northern Sierra Nevada, Final Report.
W77-03213 3B

Weather Modification Design Study for Streamflow Augmentation in the Northern Sierra Nevada, Volume II - Physical and Statistical Design, Final Report.
W77-03214 3B

METHACRYLATES
Hygienic Substantiation of the Maximum Permissible Concentration of Tin Tributylmethacrylate in Water Bodies, (In Russian),
W77-03107 5A

METHANE
Biochemical Mechanisms in the Methane Fermentation of Glutamic and Oleic Acids,
W77-03441 5D

METHODOLOGY
Molecular Activation Analysis and Its Application to Methylmercury Determination in Various Marine Samples,
W77-03202 5A

Methods of Dissoled Oxygen Budget Analysis for Assessing Effects of Dredged Material Disposal on Biological Community Metabolism,
W77-03393 5C

Nature Preservation Activity RR Investigation: Part 6. A Modified Method of Measuring the Chemical Oxygen Demand Gives a High Analytical Capacity, (In Swedish),
W77-03589 5A

METHYLMERCURY
Molecular Activation Analysis and Its Application to Methylmercury Determination in Various Marine Samples,
W77-03202 5A

MEXICO
Plankton of Coastal Lagoons: XI. Transport in Three Estuaries of the Northwest of Mexico (November, 1973) (In Spanish),
W77-03145 2L

MICHIGAN
Beach Processes, Perrien County, Michigan,
W77-03095 2J

Computer Mapping of Water Quality in Saginaw Bay with Landsat Digital Data,
W77-03305 5A

The Effects of Sewage Effluent on Wetland Ecosystems,
W77-03354 5C

Investigations on the Role of Dissolved Organic Matter in Determining Ecosystem Structure and Function: The Plankton and Photoheterotrophy,
W77-03389 5C

Response of Daphnia Population Size and Age Structure to Predation,
W77-03390 2H

MICROBIAL DEGRADATION
Baseline Study of Microbial Activity in the Beaufort Sea and Gulf of Alaska and Analysis of Crude Oil Degradation by Psychrophilic Bacteria,
W77-03223 5C

MICROBIOLOGY
The Influence of Carbon-Nitrogen Ratio on the Chlorination of Microbial Aggregates,
W77-03414 5D

MICROCLIMATOLOGY
Diurnal Fluctuation of Leaf-Water Potential of Corn as Influenced by Soil Matric Potential and Microclimate,
W77-03394 3F

MICROFLOTATION
Flotation for Water and Wastewater Treatment,
W77-03576 5D

MICROORGANISMS
Sanitary-Bacteriological Study of the Effectiveness of Decontaminating the Sewage of Voroshilovgrad on Sewage Farms, (In Russian),
W77-03128 5D

Assessment of Potential Interactions of Microorganisms and Pollutants Resulting from Petroleum Development on the Outer Continental Shelf in the Beaufort Sea,
W77-03217 5C

Assessment of Potential Interactions of Microorganisms and Pollutants Resulting from Petroleum Development on the Outer Continental Shelf in the Gulf of Alaska,
W77-03218 5C

Environmental Assessment of Alaskan Waters - Trace Element Methodology - Inorganic Elements,
W77-03220 5A

Baseline Study of Microbial Activity in the Beaufort Sea and Gulf of Alaska and Analysis of Crude Oil Degradation by Psychrophilic Bacteria,
W77-03223 5C

A Study of Substrate Removal in a Microbial Film Reactor,
W77-03480 5D

MIDDLE CREEK (NB)
Flood Plain Information: Metropolitan Region, Lincoln, Nebraska, Volume II, Summary Report, Antelope Creek, Dead Mans Run, and Middle Creek, Salt Creek Basin.
W77-03180 4A

MINE DRAINAGE
Commonwealth V. Barnes and Tucker Company (Public Nuisance of Acid Mine Drainage).
W77-03519 6E

MINE WASTES
Hydrologic Studies by the U.S. Geological Survey in Oil-Shale Areas of Colorado, Utah, and Wyoming, 1976.
W77-03340 4B

Commonwealth V. Barnes and Tucker Company (Public Nuisance of Acid Mine Drainage).
W77-03519 6E

MINERALIZATION
Effect of Added Salts on Nitrogen Released and Nitrate Levels in Forest Soils of the Washington Coastal Area,
W77-03396 2G

MINERALOGY
Heavy-Mineral Trends in the Beaufort Sea,
W77-03254 2L

MINING WASTES
Heavy Metals in Lakes of the Coeur d'Alene River Valley, Idaho,

OXYGEN DEMAND
Effect of Variable Loading on Oxygen Uptake,
W77-03473 5D

OXYGEN TRANSFER
Investigation of Oxygen Transfer to Slime as a Surface Reaction,
W77-03476 5B

Aeration and Oxygen Transfer in Biological Reactors,
W77-03575 5D

OXYGEN UPTAKE
The Electrolytic Respirometer - I. Factors Affecting Oxygen Uptake Measurements,
W77-03457 5A

Effect of Variable Loading on Oxygen Uptake,
W77-03473 5D

OXYGENATION
An Economic Evaluation of Deep Tank Aeration for Wastewater Treatment,
W77-03580 5D

OYSTERS
Rehabilitation of Pamlico Sound Oyster Producing Grounds Damaged or Destroyed by Hurricane Ginger,
W77-03562 6B

OZONATION
Comparative Assessment of the Effectiveness of Certain Methods Making Industrial Effluents Noncarcinogenic, (In Russian),
W77-03488 5D

OZONE
Decontamination of Water Contaminated with Polycyclic Aromatic Hydrocarbons (PAH). I. Action of Chlorine and Ozone on PAH Dissolved in Doubly Distilled and in De-Ionized Water,
W77-03369 5D

PACIFIC NORTWEST (US)
Electric Power Development in the Pacific Northwest Region: Institutional Commitments and Alternatives, Phase I,
W77-03288 6E

PACIFIC OCEAN
Distribution and Source of Tar on the Pacific Ocean,
W77-03191 5B

PACKAGE PLANTS
Effect of Variable Loading on Oxygen Uptake,
W77-03473 5D

PAINTS
Paint Formulating Point Source Category Effluent Guidelines and Standards.
W77-03526 5G

PAMLICO SOUND (NC)
Flow Dynamics of the Neuse River Estuary,
W77-03300 2L

Rehabilitation of Pamlico Sound Oyster Producing Grounds Damaged or Destroyed by Hurricane Ginger,
W77-03562 6B

PATENTS
Activated Sludge Waste Water Treatment Process - Using Succession of Aerobic and Anaerobic Zones to Remove Nitrogenous Material.
W77-03402 5D

Screening Apparatus for Removal of Solids - From Sewage with Rotating Screen and Vertical Lift for Residues.
W77-03403 5D

Biological Treatment of Sewage Waters - Device with Internal Aeration Zone,
W77-03404 5D

Sludge Collector and Light Liquid Separator-From Sewage with Two Tanks in Single Housing and Cover.
W77-03405 5D

Sewerage Treatment Apparatus,
W77-03406 5D

Biological Purification of Sewage Water-In a Multi-Stage Treatment Tank With Rotating Contactor Surfaces Partly Immersed in the Liquid.
W77-03407 5D

Coagulation Clarifying Effluents Contaminated with Colloid Suspensions-By Electrophoresis After Mixing in Insoluble Metallic Particles.
W77-03408 5D

Biological Converter for Faecal Matter in Water - Using Rotary Tubes With Fibrous Filling Supporting the Bacterial Culture.
W77-03409 5D

Centrifuge for Dewatering Sewage Sludge.
W77-03410 5D

Integral Circular Wastewater Treatment Plant.
W77-03411 5D

Removal of BOD and Nitrogenous Pollutants from Wastewaters,
W77-03486 5D

Sewage Sludge Treatment System,
W77-03487 5D

Fluidized Waste Incinerator and Method,
W77-03489 5D

PATH OF POLLUTANTS
Coastal Region Residence Time Estimates from Concentration Gradients,

W77-03374 5C

The Primary Production of Lake Sibaya, Kwazulu, South Africa,
W77-03376 5C

Phytoplankton Response to Phosphorus and Silica Enrichments in Lake Michigan,
W77-03537 5C

PRIOR APPROPRIATION
Rights to Water.
W77-03494 6E

PRIORITIES
Talley V Carley (Priorities to Water in 1963 Amendment to 82 Oklahoma Statutes Annotated Section 1-A).
W77-03521 6E

PROBABILITY THEORY
Wet and Dry Periods of Annual Flow Series,
W77-03319 2E

PROCESS DESIGN
An Evaluation of Aqueous Phase Catalytic Oxidation,
W77-03079 5D

PRODUCTIVITY
Growth, Mortality and Production of Brachysynodontis Batensoda (Pisces, Mochocidae) in the Southeastern Archipelago of Lake Tchad, (In French),
W77-03597 2H

PROJECT POST-EVALUATION
The Muddy Road to Clean Water,
W77-03587 5G

PROJECTIONS
Projections of Population, Employment, Income and Water Use for Iowa River Basins, 1975-2020,
W77-03542 6D

PROJECTS
Annual Report, 1975-1976, (Hawaii Water Resources Research Center),
W77-03165 9D

PROTECTION
Public Inland Lake Protection and Rehabilitation.
W77-03510 6E

PROTOTYPE TESTS
Cavitation From Surface Irregularities in High Velocity,
W77-03082 8B

PRUDHOE BAY
Offshore Permafrost-Drilling, Boundary Conditions, Properties, Processes and Models,
W77-03261 5B

PSYCHOLOGICAL ASPECTS
Environmental Concern as a Factor in Coastal Zone Development: A Study of Louisiana Citizens,
W77-03590 6G

PSYCHROPHILIC BACTERIA
Baseline Study of Microbial Activity in the Beaufort Sea and Gulf of Alaska and Analysis of Crude Oil Degradation by Psychrophilic Bacteria,
W77-03223 5C

PUBLIC ACCESS
Clippinger V Birge (Riparian Rights in an Artificial Lake).
W77-03512 6E

PUBLIC BEACH ACCESS
Freedom of Beach,
W77-03584 6E

PUBLIC HEALTH
National Safe Drinking Water Strategy, One Step at a Time.
W77-03357 5G

Preliminary Assessment of Suspected Carcinogens in Drinking Water: Report to Congress.

Report on Pollution in Las Vegas Wash and Las Vegas Bay.
W77-03371 5C

Water, Lighting and Sewers.
W77-03506 6E

PUBLIC INLAND LAKES
Public Inland Lake Protection and Rehabilitation.
W77-03510 6E

PUBLIC PARTICIPATION
The Legal Framework for Public Participation in Canadian Water Management,
W77-03543 6E

PUBLIC RIGHTS
Electric Power Development in the Pacific Northwest Region: Institutional Commitments and Alternatives, Phase I,
W77-03288 6E

The Legal Framework for Public Participation in Canadian Water Management,
W77-03543 6E

PUBLICATIONS
Publications List of the Idaho Water Resources Research Institute,
W77-03154 10C

PULP AND PAPER INDUSTRY
Pollution of Interstate Waters of the Lower Columbia River Bonneville Dam to Cathlamet, Washington.
W77-03385 5B

PUMPING
Physiochemical and Biological Conditions in Two Oklahoma Reservoirs Undergoing Artificial Destratification,
W77-03208 2H

PUMPING

Maps Showing Ground-Water Conditions in the San Simon Area, Cochise and Graham Counties, Arizona, and in Hidalgo County, New Mexico--1975,
W77-03327 7C

PUMPKINSEED (FISH)
Distribution and Feeding of Pumpkinseed (Lepomis gibbosus) and Black Crappie (Pomoxis nigromaculatus) in a power plant cooling lake,
W77-03078 5C

PUMPS
Physiochemical and Biological Conditions in Two Oklahoma Reservoirs Undergoing Artificial Destratification,
W77-03208 2H

Large Factory-Built Pump Station Begins Operation.
W77-03438 8C

PUNCTURE RESISTANCE
Plastic-Reinforced Asphalt Seepage Barrier,
W77-03120 3B

PYROLYSIS
Combined Process of Pyrolysis and Combustion for Sludge Disposal,
W77-03415 5D

Sewage Sludge Treatment System,
W77-03487 5D

QUALITY CONTROL
Trace Hydrocarbon Analysis in Previously Studied Matrices and Methods Development for: (A) Trace Hydrocarbon Analysis in Sea Ice and at the Sea Ice-Water Interface, (B) Analysis of Individual High Molecular Weight Aromatic Hydrocarbons,
W77-03219 5A

RADAR
Guidelines for Flash Flood and Small Tributary Flood Prediction,
W77-03114 4A

Development and Operation of HF Current-Mapping Radar Units-Physical Oceanography,
W77-03227 5B

RAINBOW TROUT
Effects of Mercury and Copper on the Olfactory Response in Rainbow Trout, Salmo Gairdneri,
W77-03184 5C

Effect of Copper on Some Aspects of the Bioenergetics of Rainbow Trout (Salmo gairdneri),
W77-03203 5C

Effects of Chronic DDT/DDE Exposure on Anesthetic Induction and Recovery Times in Rainbow Trout (Salmo Gairdneri),
W77-03204 5C

Response of Daphnia Population Size and Age Structure to Predation,
W77-03390 2H

RAINFALL
Rainfall in the Seychelles 1941 to 1970,
W77-03096 2B

Guidelines for Flash Flood and Small Tributary Flood Prediction,
W77-03114 4A

RAINWATER
The Composition of Rainwater at Two Sites Near Townsville, Qld. (Australia),
W77-03279 2K

REAL PROPERTY
Water Rights and Liens.
W77-03499 6E

RECESSION CURVES
Normal-Mode Analysis of the Structure of Baseflow Recession Curves,
W77-03313 2F

RECLAIMED WATER
Research Needs for the Potable Reuse of Municipal Wastewater,
W77-03356 5D

Rapid Detection of Bacterial Endotoxins in Drinking Water and Renovated Waste Water,
W77-03474 5A

RECLAMATION
Residual Waste Management Research and Planning Projects, September 1975,
W77-03355 5B

Research Needs for the Potable Reuse of Municipal Wastewater,
W77-03356 5D

RECLAMATION STATES
Water for Nevada. Water Planning Report.
W77-03545 6B

RECREATION
Multiple Use in the Southern Coastal Plains in the United States,
W77-03173 4C

RECREATION FACILITIES
Water Usage and Wastewater Characterization at a Crops of Engineers Recreation Area,
W77-03362 5A

RECREATIONAL WATERS
The Relationship of Bottom Sediments to Bacterial Water Quality in a Recreational Swimming Area,
W77-03167 5B

RECYCLING
Land Based Sewage Sludge Management Alternatives for Los Angeles: Evaluation and Comparison,
W77-03289 5D

Sewage Sludge Treatment System,
W77-03487 5D

ermentation of Waste Materials to Produce Industrial Intermediates,
W77-03563 5D

REFORESTATION
Afforestation in Low Rainfall Areas,
W77-03139 4D

REGIONAL ANALYSIS
User Oriented Systems Analysis for Regional Municipal Water Supply Planning,
W77-03159 6A

REGRESSION ANALYSIS
Depth and Frequency of Floods in Illinois,
W77-03346 2E

REGULATION
Individual Sewage Disposal System Act.
W77-03491 6E

Secondary Treatment Information; Biochemical Oxygen Demand, Suspended Solids and
W77-03530

The Cost of Coastal Zoning.
W77-03535

REHABILITATION
Public Inland Lake Protection and Rehabilitation.
W77-03510

REINFORCEMENT
Plastic-Reinforced Asphalt Seepage Barrier
W77-03120

REMOTE SENSING
Radio-Echo Layers and the Recent Stability of the West Antarctic Ice Sheet,
W77-03100

Operation of an Alaskan Facility for Applications of Remote-Sensing Data to OCS Studies
W77-03277

Computer Mapping of Water Quality in Saginaw Bay with Landsat Digital Data,
W77-03305

The Aerial Photo-Water Quality Link.
W77-03471

RENOVATION
Renovation of Municipal Wastewater by Groundwater Recharge by the Living Filter Method,
W77-03147

REPRODUCTION
Effects of Oil Pollution on Breeding Seals,
W77-03187

REPRODUCTIONS
Effects on Fertilization and Development of the Common Mussel, Mytilus Edulis Long-Term Exposure to a Nonionic Surfa
W77-03198

RESEARCH AND DEVELOPMENT
Annual Report, 1975-1976, (Hawaii Resources Research Center),
W77-03165

Report on Tenth Annual Water Resources Research Conference, Sponsored by Office of Water Research and Technology, April 1975.
W77-03206

RESEARCH PRIORITIES
Report on Tenth Annual Water Resources Research Conference, Sponsored by Office of Water Research and Technology, April 1975.
W77-03206

RESERVOIR OPERATION
Probable Maximum Flood at Lake Chetek near Winter, Wisconsin,
W77-03349

RESERVOIR RELEASES
Two Dimensional Bottom Withdrawal from a Density-Stratified Reservoir.
W77-03129

A Perturbation Approach to Two-Dimensional Bottom Withdrawal from a Density-Stratified Reservoir,
W77-03151

ublications List of the Idaho Water Resources esearch Institute,
77-03154 10C

nnual Report, 1975-1976, (Hawaii Water esources Research Center),
77-03165 9D

TER RESOURCES RESEARCH ACT
eport on Tenth Annual Water Resources esearch Conference, Sponsored by Office of ater Research and Technology, April 9-10, 75.
77-03206 9D

TER REUSE
nitary-Bacteriological Study of the Effectiveess of Decontaminating the Sewage of oroshilovgrad on Sewage Farms, (In Rusn),
77-03128 5D

novation of Municipal Wastewater for roundwater Recharge by the Living Filter ethod,
77-03147 5D

itability of Lagoon Effluents for Irrigation in uth Dakota,
77-03152 5D

havior of Ground Water Subject to Irrigation Effluent - A Case Study,
77-03158 5D

esearch Needs for the Potable Reuse of Mucipal Wastewater,
77-03356 5D

aste-Treatment 'Farm' Harvests Firms.
77-03420 5D

S. Air Force Greens Colorado.
77-03431 5D

novation is an Old Idea--With A Big Future,
77-03482 5D

astewater's Future is Cloudy,
77-03577 5D

Keep Cool with Sewage Effluent - A Two-Way Saving of Water,
W77-03578 3E

WATER RIGHTS
Rights to Water.
W77-03494 6E

Water Rights and Liens.
W77-03499 6E

Ditch Companies.
W77-03501 6E

Irrigation and Water Rights.
W77-03502 6E

General Basis of Water Rights in Utah.
W77-03504 6E

Water, Lighting and Sewers.
W77-03506 6E

Water Rights,
W77-03599 6E

WATER RIGHTS (NON-RIPARIAN)
Rights to Water.
W77-03494 6E

A Sweeping Sea Law in 1976.
W77-03533 6E

WATER SUPPLY
The Occurrence of Groundwater in the Satpura Region of Central India,
W77-03146 4B

Precautions to be Taken in the Construction and Maintenance of Water Supply and Sewer Systems (Precautions a Prendre Dans La Construction Et L'Entretien Des Reseaux D' Aqueduc Et D' Egout),
W77-03400 8G

Monitoring of Community Water Supplies,
W77-03463 5A

Water, Lighting and Sewers.
W77-03506 6E

Suspension and Restoration of Right to Appropriate.
W77-03508 6E

WATER SURFACE PROFILES
Hydrologic Engineering Methods for Water Resources Development, Volume 6, Water Surface Profiles,
W77-03105 8B

WATER TABLE
Behavior of Ground Water Subject to Irrigation of Effluent - A Case Study,
W77-03158 5D

WATER TEMPERATURE
Effect of Temperature and Salinity on Extension of Siphons by Mercenaria Mercenaria,
W77-03205 5C

Allatoona Lake, Destratification Equipment Test, Appendix D, Effects of Artificial Destratification on Temperature and Dissolved Oxygen in Allatoona Reservoir.
W77-03310 5G

WATER TREATMENT
Decontamination of Water Contaminated with Polycyclic Aromatic Hydrocarbons (PAH). I. Action of Chlorine and Ozone on PAH Dissolved in Doubly Distilled and in De-Ionized Water,
W77-03369 5D

'Give Flotation a Try' was Challenged.
W77-03439 5F

Effect of Water Chlorination Upon Levels of Some Polynuclear Aromatic Hydrocarbons in Water,
W77-03459 5F

Investigations on the Importance of the Organic Chloro-Compounds and their Adsorbability (Untersuchungen Zur Bedeutung der Organischen Chlorverbindungen und Ihrer Adsorbierbarkeit),
W77-03465 5A

Innovation is an Old Idea--With A Big Future,
W77-03482 5D

Flotation for Water and Wastewater Treatment,
W77-03576 5D

Nature Preservation Activity RR Investigation: Part 6. A Modified Method of Measuring the Chemical Oxygen Demand Gives a High Analytical Capacity, (In Swedish),
W77-03589 5A

WATER USERS
Rights to Water.
W77-03494 6E

WATER UTILIZATION
Rates of Photosynthesis and Transpiration and Diffusive Resistance of Six Grasses Grown under Controlled Conditions,
W77-03142 2D

Ground-Water Levels in New Mexico, 1975,
W77-03330 7C

Water Usage and Wastewater Characterization at a Crops of Engineers Recreation Area,
W77-03362 5A

Suspension and Restoration of Right to Appropriate.
W77-03508 6E

Urban Water Use in California.
W77-03549 6B

WATER WAVE MODELS
Landslide Generated Water Wave Model,
W77-03318 8B

WATER WELLS
Maps Showing Ground-Water Conditions in the San Simon Area, Cochise and Graham Counties, Arizona, and in Hidalgo County, New Mexico--1975,
W77-03327 7C

Maps Showing Ground-Water Conditions in the San Bernardino Valley Area Cochise County, Arizona--1975,
W77-03328 7C

Chemical Composition Data and Calculated Aquifer Temperature for Selected Wells and Springs of Honey Lake Valley, California.
W77-03342 2K

Ground-Water Resources of Greeley and Wichita Counties, Western Kansas,
W77-03347 4B

Selected Data on Water Wells, Geothermal Wells, and Oil Tests in Imperial Valley, California,
W77-03348 7C

Significance of Nitrates in Drinking Water, (In Russian),
W77-03541 5B

WATER YIELD
Buried Aquifers in the Brooten-Belgrade and Lake Emily Areas, West-Central Minnesota--Factors Related to Developing Water for Irrigation,
W77-03335 4B

Appraisal of Water Resources in the Hackensack River Basin, New Jersey,
W77-03336 2F

Summary of Geology and Ground-Water Resources of Passaic County, New Jersey,
W77-03345 4B

Ground-Water Resources of Greeley and Wichita Counties, Western Kansas,
W77-03347 4B

WATERSHED MANAGEMENT
Hydrologic Inventory of the San Rafael Study Unit.
W77-03552 4A

WATERSHED PARAMETERS
The Unit Hydrograph: A Satisfactory Model of Watershed Response,
W77-03126 4D

WATERSHEDS (BASINS)
State and County Area Tabulations for the Colorado River Basin,
W77-03110 7C

OPTRM - A Hydrologic Transport Model With Parameter Optimization,
W77-03115 5B

Environmental Status of the Lake Michigan Region. Vol. 17. Inland Fishes of the Lake Michigan Drainage Basin,
W77-03566 6G

WATERWAY DISTRICTS
Waterway Districts.
W77-03516 6E

WAVE CLIMATES
Coastal Dynamics and Sediment Transportation, Northeast Gulf of Alaska,
W77-03245 2L

WAVE ENERGY
Coastal Dynamics and Sediment Transportation, Northeast Gulf of Alaska,
W77-03245 2L

WAVE REFRACTION
Coastal Dynamics and Sediment Transportation, Northeast Gulf of Alaska,
W77-03245 2L

WAVES (WATER)
High-Wave Conditions Observed Over the North Atlantic in September 1961,
W77-03090 2L

Landslide Generated Water Wave Model,
W77-03318 8B

WEATHER DATA
Coastal Dynamics and Sediment Transportation, Northeast Gulf of Alaska,
W77-03245 2L

WEATHER FORECASTING
Preparation of Hydrodynamical-Numerical and 3-Parameter Small-Mesh Atmospheric Models for Coastal Waters in the Gulf of Alaska,
W77-03235 5B

WEATHER MODIFICATION
Weather Modification Design Study for Streamflow Augmentation in the Northern Sierra Nevada, Executive Summary,
W77-03212 3B

Weather Modification Design Study for Streamflow Augmentation in the Northern Sierra Nevada, Volume I - Meteorology and Hydrology of the Northern Sierra Nevada, Final Report.
W77-03213 3B

Weather Modification Design Study for Streamflow Augmentation in the Northern Sierra Nevada, Volume II - Physical and Statistical Design, Final Report.
W77-03214 3B

Weather Modification Design Study for Streamflow Augmentation in the Northern Sierra Nevada, Volume III - Operational Design, Final Report.
W77-03215 3B

Electrostatic Induction Parameters to Attain Maximum Spray Charge to Clear Fog,
W77-03299 3B

Artificial Modification of Atmospheric Processes,
W77-03303 3B

WEIRS
Experimental Investigation of Flow Over Side Weirs,
W77-03317 8B

WELL DATA
The Occurrence of Groundwater in the Satpura Region of Central India,
W77-03146 4B

Appraisal of Water Resources in the Hackensack River Basin, New Jersey,
W77-03336 2F

Summary of Geology and Ground-Water Resources of Passaic County, New Jersey,
W77-03345 4B

Selected Data on Water Wells, Geothermal Wells, and Oil Tests in Imperial Valley, California,
W77-03348 7C

WELLS
Cache La Poudre Water Users Association V Glacier View Meadows (Appropriation of Water in Plan of Augmentation).
W77-03520 6E

WEST BRANCH DELAWARE RIVER (NY)
Floodflow Characteristics at Proposed Bridge Site Above Sherwood Road on West Branch Delaware River, Delhi, New York,
W77-03337 4A

WESTER US (WATER PROBLEMS)
An Appraisal of Conflicting Institutional Attitudes on the Westwide Study Report.
W77-03157 6B

WESTERN UNITED STATES
1973 Western State Conference on Water Information Dissemination.
W77-03166 10C

WESTWIDE STUDY REPORT
An Appraisal of Conflicting Institutional Attitudes on the Westwide Study Report.
W77-03157 6B

WETLANDS
The Effects of Sewage Effluent on Wet Ecosystems,
W77-03354

WHEATGRASSES
Rates of Photosynthesis and Transpiration Diffusive Resistance of Six Grasses Gr under Controlled Conditions,
W77-03142

WILDCAT CREEK (IN)
Flood Plain Information: Wildcat Creek Kokomo Creek, Vicinity of Kokomo, Ho County, Indiana.
W77-03182

WILDLIFE
Multiple Use in the Southern Coastal Plai the United States,
W77-03173

WILMINGTON CANYON
Large Sand Waves on the Atlantic Outer tinental Shelf Around Wilmington Canyon Eastern United States,
W77-03332

WINDS
Electronic Sensor for Low-to-Medium W speeds,
W77-03099

Wind-Induced Water Level Oscillation Shallow Lagoons,
W77-03287

WINDSPEED SENSORS
Electronic Sensor for Low-to-Medium W speeds,
W77-03099

WINTER
Shelters Boost Winter Treatment Efficienc
W77-03432

WINTER STORMS
Weather Modification Design Study Streamflow Augmentation in the Northern ra Nevada, Executive Summary,
W77-03212

WISCONSIN
Distribution of Pelagic Zooplankton wit Thermal Gradient in Lake Columbia, a Co Lake near Portage, Wisconsin,
W77-03077

Distribution and Feeding of Pumpki (Lepomis gibbosus) and Black Cr (Pomoxis nigromaculatus) in a power cooling lake,
W77-03078

Organic Phosphorus in Lakes,
W77-03210

Probable Maximum Flood at Lake Chip near Winter, Wisconsin,
W77-03349

Public Inland Lake Protection and Reha tion.
W77-03510

Great Lakes Compact Commission.
W77-03513

WITHDRAWAL
Two Dimensional Bottom Withdrawal fr Density-Stratified Reservoir,
W77-03129

U. OF I. URBANA-CHAMPAIGN

Perturbation Approach to Two-Dimensional ottom Withdrawal from a Density-Stratified eservoir,
77-03151 4A

OMING
ermeability and Ground Water Circulation in e Madison Aquifer Along the Eastern Flank the Bighorn Mountains of Wyoming,
77-03122 2F

ydrologic Studies by the U.S. Geological Sur-ey in Oil-Shale Areas of Colorado, Utah, and yoming, 1976.
77-03340 4B

ater Rights and Liens.
77-03499 6E

isoning of, and Obstruction to, Fish.
77-03500 6E

itch Companies.
77-03501 6E

rigation and Water Rights.
77-03502 6E

ontrol of Water and Eminent Domain.
77-03503 6E

ne Wyoming Water Quality Act and the ederal Water Pollution Control Act Amend-ents of 1972: A Comparison,
77-03600 5G

PER ARROYO (NM)
ood Plain Information: San Juan River and ributaries, Farmington, New Mexico.
77-03176 4A

C TOXICITY
ffect of Zinc-Coated Culverts on Vertebrate nd Invertebrate Fauna in Selected Maine reams,
77-03170 5C

NING
ne Cost of Coastal Zoning.
77-03535 6E

OPLANKTON
istribution of Pelagic Zooplankton within a hermal Gradient in Lake Columbia, a Cooling ake near Portage, Wisconsin,
77-03077 5C

LIBRARY U. OF I. URBANA-CHAMPAIGN
